|               |        |        |        |        | T1                                       |                                         |                                      |                                                                                                                                                          | PLC READY signal OFF confirmation |                                    |                      |

### 6.3 Creating a program

The "positioning control operation program" actually used is explained in this chapter. The functions and programs explained in PART 2 are assembled into the "positioning control operation program" explained here. (To monitor the control, add the required monitor program that matches the system. Refer to Section 5.6 "List of monitor data" for details on the monitor items.)

#### 6.3.1 General configuration of program

The general configuration of the "positioning control operation program" is shown below.

## 6.3.2 Positioning control operation program

The various programs that configure the "positioning control operation program" are shown below. When creating the program, refer to the explanation of each program and Section 6.4 "Positioning program examples", and create an operation program that matches the positioning system. (Numbers are assigned to the following programs. Configuring the program in the order of these numbers is recommended.)

## 6.4 Positioning program examples

An example of the "Axis 1" positioning program is given in this section.

----- [No. 1] to [No. 3] parameter and data setting program -----

- \* When setting the parameters or data with the sequence program, set them in the QD75 using the TO instruction from the CPU module. (Carry out the settings while the PLC READY signal [Y0] is OFF.)
- \* When setting the parameters or data with GX Configurator-QP, the [No. 1] to [No. 3] program is not necessary.

\*  
 \* No. 2 Positioning data setting program  
 \* (For positioning data No. 1 <axis 1>)  
 \* <Positioning identifier>  
 \* Operation pattern: Positioning complete  
 \* Control system: 1-axis linear control (ABS)  
 \* Acceleration time No.: 1, deceleration time No.: 2  
 \*

\* Positioning option enable/disable parameter setting program  
 \* (The program is not required when positioning option is not used.)

\*  
 \* No. 2 Positioning data setting program  
 \* (For using positioning option)  
 \* (For positioning data No. 1 <axis 1>)  
 \* <Positioning identifier>  
 \* Operation pattern: Positioning complete  
 \* Control system: 1-axis linear control (ABS)  
 \* Acceleration time No.: 1, deceleration time No.: 2  
 \* <Positioning option>  
 \* M code ON signal output timing: WITH mode (1)  
 \* ABS direction in degrees: 0  
 \* Interpolation speed designation method: 0  
 \*

\*  
 \* No. 3 Block start data setting program  
 \* Block start data of start block 0 (axis 1)  
 \* For setting of points 1 to 5  
 \* (Conditions)  
 \* Shape: Continued at points 1 to 4, ended at point 5  
 \* Special start instruction: Normal start at all of points 1 to 5  
 \* <Positioning data are already preset>  
 \*  
 \*  
 \* [Setting of shape and start data No.]  
 \*

\*  
 \* [Setting of special start instruction to normal start]  
 \*

\*  
\* No. 13 Manual pulse generator operation program  
\*

\*  
\* No. 14 Speed change program  
\*

\*  
\* No. 15 Override program  
\*

\*  
\* No. 16 Acceleration/deceleration time change program  
\*

\*  
\* No. 22 Absolute position restoration program  
\* (1) Absolute position restoration command acceptance  
\*

\*  
\* (2) Setting of transmit data to servo-amplifier and confirmation of absolute position restoration completion  
\* ABRST1 instruction completed when M42 is ON and M43 is OFF.  
\* Absolute position data restoration completed when status = 0.  
\*

\*  
\* (3) ABS data setting and ABRST1 instruction execution  
\*

\*  
\* No. 23 Restart program  
\*

\*  
\* No. 24 Parameter initialization program  
\*

\*  
\* No. 25 Flash ROM write program  
\*

\*  
\* No. 26 Error reset program  
\*

\*  
\* No. 27 Stop program  
\*

## 6.5 Program details

### 6.5.1 Initialization program

#### [1] OPR request OFF program

This program forcibly turns OFF the "OPR request flag" ([Md.31] Status : b3) which is ON.

When using a system that does not require OPR, assemble the program to cancel the "OPR request" made by the QD75 when the power is turned ON, etc.

#### ■ Data requiring setting

Set the following data to use the OPR request flag OFF request.

| Setting item                         | Setting value | Setting details                        | Buffer memory address |        |        |        |
|--------------------------------------|---------------|----------------------------------------|-----------------------|--------|--------|--------|
|                                      |               |                                        | Axis 1                | Axis 2 | Axis 3 | Axis 4 |
| [Cd.19] OPR request flag OFF request | 1             | Set to "1: Turn OPR request flag OFF". | 1521                  | 1621   | 1721   | 1821   |

\* Refer to Section 5.7 "List of control data" for details on the setting details.

#### ■ Time chart for OPR request OFF

Fig. 6.1 Time chart for OPR request OFF

#### [2] External command function valid setting program

This program is used to validate the "external command signal" beforehand when using the external command functions (external start, speed change, speed-position switching, position-speed switching, skip). (Set which function to use beforehand in " [Pr.42] External command function selection".)

Set the following data to validate the "external command signal".

| Setting item                  | Setting value | Setting details                        | Buffer memory address |        |        |        |
|-------------------------------|---------------|----------------------------------------|-----------------------|--------|--------|--------|
|                               |               |                                        | Axis 1                | Axis 2 | Axis 3 | Axis 4 |
| [Cd.8] External command valid | 1             | Set to "1: Validate external command". | 1505                  | 1605   | 1705   | 1805   |

\* Refer to Section 5.7 "List of control data" for details on the setting details.

## 6.5.2 Start details setting program

This program sets which control, out of "OPR", "major positioning control" or "high-level positioning control" to execute. For "high-level positioning control", "fast OPR", "speed-position switching control" and "position-speed switching control", add the respectively required sequence program.

(Refer to CHAPTER 10 for details on starting the "high-level positioning control".)

### ■ Procedures for setting the starting details

- (1) Set the "positioning start No." corresponding to the control to be started in " **Cd.3** Positioning start No.".

| Setting item                      | Setting value | Setting details                                                                                                                                                                                              | Buffer memory address |        |        |        |
|-----------------------------------|---------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-----------------------|--------|--------|--------|
|                                   |               |                                                                                                                                                                                                              | Axis 1                | Axis 2 | Axis 3 | Axis 4 |
| <b>Cd.3</b> Positioning start No. | →             | 1 to 600 : Positioning data No.<br>9001 : Machine OPR<br>9002 : Fast OPR<br>9003 : Current value changing<br>9004 : Simultaneous start<br>7000 to 7004 : Block No.<br>(For "high-level positioning control") | 1500                  | 1600   | 1700   | 1800   |

\* Refer to Section 5.7 "List of control data" for details on the setting details.

- (2) For "high-level positioning control", set the "positioning start point No." of the block to be started in " **Cd.4** Positioning starting point No.".

| Setting item                               | Setting value | Setting details                         | Buffer memory address |        |        |        |
|--------------------------------------------|---------------|-----------------------------------------|-----------------------|--------|--------|--------|
|                                            |               |                                         | Axis 1                | Axis 2 | Axis 3 | Axis 4 |

\* Refer to Section 5.7 "List of control data" for details on the setting details.

## 6.5.3 Start program

This program is used to start the control with start commands.

The control can be started with the following two methods.

- [1] Starting by inputting positioning start signal [Y10, Y11, Y12, Y13]
- [2] Starting by inputting external command signal

Fig. 6.2 Procedures for starting control (for axis 1)

### ■ Starting conditions

To start the control, the following conditions must be satisfied.

The necessary start conditions must be incorporated in the sequence program so that the control is not started when the conditions are not satisfied.

| Signal name      |                         | Signal state |                                  | Device |        |        |        |
|------------------|-------------------------|--------------|----------------------------------|--------|--------|--------|--------|
|                  |                         |              |                                  | Axis 1 | Axis 2 | Axis 3 | Axis 4 |
| Interface signal | PLC READY signal        | ON           | CPU module preparation completed | Y0     |        |        |        |
|                  | QD75 READY signal       | ON           | QD75 preparation completed       | X0     |        |        |        |
|                  | Synchronization flag *  | ON           | QD75 buffer memory Accessible    | X1     |        |        |        |
|                  | Axis stop signal        | OFF          | Axis stop signal is OFF.         | Y4     | Y5     | Y6     | Y7     |
|                  | M code ON signal        | OFF          | M code ON signal is OFF.         | X4     | X5     | X6     | X7     |
|                  | Error detection signal  | OFF          | No error is present.             | X8     | X9     | XA     | XB     |
|                  | BUSY signal             | OFF          | BUSY signal is OFF.              | XC     | XD     | XE     | XF     |
| External signal  | Start complete signal   | OFF          | Start complete signal is OFF.    | X10    | X11    | X12    | X13    |
|                  | Drive unit READY signal | ON           | Drive unit preparation completed | —      |        |        |        |
|                  | Stop signal             | OFF          | Stop signal is OFF.              | —      |        |        |        |
|                  | Upper limit (FLS)       | ON           | Within limit range               | —      |        |        |        |
|                  | Lower limit (RLS)       | ON           | Within limit range               | —      |        |        |        |

※: When the synchronous setting of the CPU module is made in the nonsynchronous mode, this must be provided as an interlock.

When it is made in the synchronous mode, no interlock must be provided in the program because the flag is turned ON when calculation is run on the CPU module.

## [1] Starting by inputting positioning start signal

## ■ Operation when starting

- (1) When the positioning start signal turns ON, the start complete signal and BUSY signal turn ON, and the positioning operation starts.  
It can be seen that the axis is operating when the BUSY signal is ON.
- (2) When the positioning start signal turns OFF, the start complete signal also turns OFF.  
If the positioning start signal is ON even after positioning is completed, the start complete signal will remain ON.
- (3) If the positioning start signal turns ON again while the BUSY signal is ON, the warning "Start during operation" (warning code: 100) will occur.
- (4) The process taken when positioning is completed will differ according to case (a) and (b) below.
  - (a) When next positioning is not to be carried out
    - If a dwell time is set, the system will wait for the set time to pass, and then positioning will be completed.
    - When positioning is completed, the BUSY signal will turn OFF and the positioning complete signal will turn ON. However, when using speed control or when the positioning complete signal ON time is "0", the signal will not turn ON.
    - When the positioning complete signal ON time is passed, the positioning complete signal will turn OFF.
  - (b) When next positioning is to be carried out
    - If a dwell time is set, the system will wait for the set time to pass.
    - When the set dwell time is passed, the next positioning will start.

Fig. 6.3 ON/OFF timing of each signal at start of positioning

**POINTS**

The BUSY signal [XC, XD, XE, XF] turns ON even when position control of movement amount 0 is executed. However, since the ON time is short, the ON status may not be detected in the sequence program.

(The ON status of the start complete signal [X10, X11, X12, X13], positioning complete signal [X14, X15, X16, X17] and M code ON signal [X4, X5, X6, X7] can be detected in the sequence program.)

### ■ Starting time chart

The time chart for starting each control is shown below.

#### (1) Time chart for starting "machine OPR"

Fig. 6.4 Time chart for starting "machine OPR"

(2) Time chart for starting "fast OPR"

Fig. 6.5 Time chart for starting "fast OPR"

## (3) Time chart for starting "major positioning control"

Fig. 6.6 Time chart for starting "major positioning control"

## (4) Time chart for starting "speed-position switching control"

Fig. 6.7 Time chart for starting "speed-position switching control"

(5) Time chart for starting "position-speed switching control"

Fig. 6.8 Time chart for starting "position-speed switching control"

### Machine OPR operation timing and process time

Fig. 6.9 Machine OPR operation timing and process time

#### Normal timing time

| Model           | t1           | t2           | t3         | t4         |
|-----------------|--------------|--------------|------------|------------|
| QD75P□N/QD75D□N | 0.2 to 1.1ms | 0.4 to 1.3ms | 0 to 0.9ms | 0 to 0.9ms |
| QD75P□/QD75D□   | 1.0 to 1.4ms | 2.7 to 4.4ms | 0 to 1.8ms | 0 to 1.8ms |

- The t1 timing time could be delayed depending on the operating conditions of the other axis.

### Position control operation timing and process time

Fig. 6.10 Position control operation timing and process time

- When the positioning start signal turns ON, if all signals marked with an asterisk (\*) are already ON, the signals marked with an asterisk (\*) will turn OFF when the positioning start signal turns ON.

#### Normal timing time

| Model           | t1           | t2         | t3         | t4           | t5         | t6                 |
|-----------------|--------------|------------|------------|--------------|------------|--------------------|
| QD75P□N/QD75D□N | 0.2 to 1.1ms | 0 to 0.9ms | 0 to 0.9ms | 0.4 to 1.3ms | 0 to 0.9ms | Follows parameters |
| QD75P□/QD75D□   | 1.2 to 2.3ms | 0 to 1.8ms | 0 to 1.8ms | 2.7 to 4.4ms | 0 to 1.8ms |                    |

- The t1 timing time could be delayed depending on the operating conditions of the other axis.

## [2] Starting by inputting external command signal

When starting positioning control by inputting the external command signal, the start command can be directly input into the QD75. This allows the variation time equivalent to one scan time of the CPU module to be eliminated. This is an effective procedure when operation is to be started as quickly as possible with the start command or when the starting variation time is to be suppressed. To start positioning control by inputting the external command signal, set the "data required to be set" and then turn ON the external command signal.

### ■ Restrictions

When starting by inputting the external command signal, the start complete signal [X10, X11, X12, X13] will not turn ON.

### ■ Data required to be set

To execute positioning start with the external command signal, set parameter (Pr.42) beforehand, and validate the "external command signal" with the "External command function valid setting program (program No. 5)".

| Setting item                              | Setting value | Setting details                         | Buffer memory address |        |        |        |
|-------------------------------------------|---------------|-----------------------------------------|-----------------------|--------|--------|--------|
|                                           |               |                                         | Axis 1                | Axis 2 | Axis 3 | Axis 4 |
| Pr.42 External command function selection | 0             | Set to "0: External positioning start". | 62                    | 212    | 362    | 512    |
| Cd.8 External command valid               | 1             | Set to "1: Validate external command".  | 1505                  | 1605   | 1705   | 1805   |

\* Refer to CHAPTER 5 "DATA USED FOR POSITIONING CONTROL" for details on the setting details.

### ■ Starting time chart

Fig. 6.11 Time chart for starting with external start signal

### 6.5.4 Continuous operation interrupt program

During positioning control, the control can be interrupted during continuous positioning control and continuous path control (continuous operation interrupt function). When "continuous operation interruption" is execution, the control will stop when the operation of the positioning data being executed ends. To execute continuous operation interruption, set "1: Continuous operation interrupt request" for " [Cd.18](#) Continuous operation interrupt request".

#### [1] Operation during continuous operation interruption

Fig. 6.12 Operation during continuous operation interruption

#### [2] Restrictions

- (1) When the "continuous operation interrupt request" is executed, the positioning will end.

Thus, after stopping, the operation cannot be "restarted".

When " [Cd.6](#) Restart command" is issued, a warning "Restart not possible" (warning code: 104) will occur.

- (2) Even if the stop command is turned ON after executing the "continuous operation interrupt request", the "continuous operation interrupt request" cannot be canceled.

Thus, if "restart" is executed after stopping by turning the stop command ON, the operation will stop when the positioning data No. where "continuous operation interrupt request" was executed is completed.

- (3) If the operation cannot be decelerated to a stop because the remaining distance is insufficient when "continuous operation interrupt request" is executed with continuous path control, the interruption of the continuous operation will be postponed until the positioning data shown below.

- Positioning data No. have sufficient remaining distance
- Positioning data No. for positioning complete (pattern: 00)
- Positioning data No. for continuous positioning control (pattern: 01)

Even when the continuous operation interrupt is requested, the remaining distance is insufficient, and thus, the operation cannot stop at the positioning No. being executed.

- (4) When operation is not performed (BUSY signal [XC, XD, XE, XF] is OFF), the interrupt request during continuous operation is not accepted. It is cleared to 0 at a start or restart.

### [3] Control data requiring settings

Set the following data to interrupt continuous operation.

| Setting item                                                                                             | Setting value | Setting details                                  | Buffer memory address |        |        |        |
|----------------------------------------------------------------------------------------------------------|---------------|--------------------------------------------------|-----------------------|--------|--------|--------|
|                                                                                                          |               |                                                  | Axis 1                | Axis 2 | Axis 3 | Axis 4 |
| <span style="border: 1px solid black; padding: 2px;">Cd.18</span> Continuous operation interrupt request | 1             | Set "1: Continuous operation interrupt request". | 1520                  | 1620   | 1720   | 1820   |

\* Refer to Section 5.7 "List of control data" for details on the setting details.

### 6.5.5 Restart program

When a stop factor occurs during position control and the operation stops, the positioning can be restarted from the stopped position to the position control end point by using the "restart command" (**Cd.6** Restart command).

("Restarting" is not possible when "continuous operation is interrupted.")

This instruction is efficient when performing the remaining positioning from the stopped position during position control of incremental system such as the INC Linear 1.

(Calculation of remaining distance is not required.)

#### [1] Restart operation

After a deceleration stop by the stop command is completed, write "1" to the " **Cd.6** Restart command" with " **Md.26** Axis operation status" is "Stopped" and the positioning restarts.

Fig. 6.13 Restart operation

#### [2] Restrictions

- (1) Restarting can be executed only when the " **Md.26** Axis operation status" is "Stopped (the deceleration stop by stop command is completed)".  
If the axis operation is not "stopped", restarting is not possible.  
In this case, a warning "Restart not possible" (warning code: 104) will occur, and the process at that time will be continued.
- (2) Restarting can be executed even while the positioning start signal is ON.  
However, make sure that the positioning start signal does not change from OFF to ON while " **Md.26** Axis operation status" is "Stopped".  
If the signal is changed from OFF to ON while " **Md.26** Axis operation status" is "Stopped", the normal positioning (the positioning data set in " **Cd.3** Positioning start signal") is started.
- (3) If the PLC READY signal is turned ON from OFF while " **Md.26** Axis operation status" is "Stopped", the positioning cannot be restarted. If restart is requested, a warning "Restart not possible" (warning code: 104) will occur.

- (4) Do not execute restart while the stop command is ON.  
If restart is executed while stopped, an error "Stop signal ON at start" (error code: 106) will occur, and the " Md.26 Axis operation status" will change to "Error".  
Thus, even if the error is reset, the operation cannot be restarted.
- (5) If positioning is ended with the continuous operation interrupt request, the operation cannot be restarted.  
If restart is requested, a warning "Restart not possible" (warning code: 104) will occur.
- (6) When stopped with interpolation operation, write "1: Restarts" into " Cd.6 Restart command" for the reference axis, and then restart.
- (7) If any of reference partner axes executes the positioning operation once, a warning "Restart not possible" (warning code: 104) will occur, and the positioning cannot restarts.
- (8) When the machine OPR and fast OPR is stopped, an error "OPR restart not possible" (error code: 209) will occur and the positioning cannot restarts.

## [3] Control data requiring setting

Set the following data to execute restart.

| Setting item                | Setting value | Setting details    | Buffer memory address |        |        |        |
|-----------------------------|---------------|--------------------|-----------------------|--------|--------|--------|
|                             |               |                    | Axis 1                | Axis 2 | Axis 3 | Axis 4 |

\* Refer to Section 5.7 "List of control data" for details on the setting details.

## [4] Starting conditions

The following conditions must be satisfied when restarting. (Assemble the required conditions into the sequence program as an interlock.)

## (1) Operation state

" **Md.26** Axis operation status" is "1: Stopped"

## (2) Signal state

| Signal name      |                         | Signal state |                                  | Device |        |        |        |
|------------------|-------------------------|--------------|----------------------------------|--------|--------|--------|--------|
|                  |                         |              |                                  | Axis 1 | Axis 2 | Axis 3 | Axis 4 |
| Interface signal | PLC READY signal        | ON           | CPU module preparation completed | Y0     |        |        |        |
|                  | QD75 READY signal       | ON           | QD75 preparation completed       | X0     |        |        |        |
|                  | Synchronization flag *  | ON           | QD75 buffer memory Accessible    | X1     |        |        |        |
|                  | Axis stop signal        | OFF          | Axis stop signal is OFF          | Y4     | Y5     | Y6     | Y7     |
|                  | M code ON signal        | OFF          | M code ON signal is OFF          | X4     | X5     | X6     | X7     |
|                  | Error detection signal  | OFF          | No error is present              | X8     | X9     | XA     | XB     |
|                  | BUSY signal             | OFF          | BUSY signal is OFF               | XC     | XD     | XE     | XF     |
|                  | Start complete signal   | OFF          | Start complete signal is OFF     | X10    | X11    | X12    | X13    |
| External signal  | Drive unit READY signal | ON           | Drive unit preparation completed | —      |        |        |        |
|                  | Stop signal             | OFF          | Stop signal is OFF               | —      |        |        |        |
|                  | Upper limit (FLS)       | ON           | Within limit range               | —      |        |        |        |
|                  | Lower limit (RLS)       | ON           | Within limit range               | —      |        |        |        |

※: When the synchronous setting of the CPU module is made in the nonsynchronous mode, this must be provided as an interlock.  
When it is made in the synchronous mode, no interlock must be provided in the program because the flag is turned ON when calculation is run on the CPU module.

## (5) Time chart for restarting

Fig. 6.14 Time chart for restarting

## 6.5.6 Stop program

The axis stop signal [Y4, Y5, Y6, Y7] or a stop signal from an external source is used to stop the control.

Create a program to turn ON the axis stop signal [Y4, Y5, Y6, Y7] as the stop program.

The process for stopping control is explained below.

Each control is stopped in the following cases.

- (1) When each control is completed normally.
- (2) When the drive unit READY signal is turned OFF.
- (3) When a CPU module error occurs
- (4) When the PLC READY signal is turned OFF.
- (5) When an error occurs in QD75.
- (6) When control is intentionally stopped  
(Stop signal from CPU module turned ON, stop signal from peripheral devices)

The stop process for the above cases is shown below.

(Excluding item (1) above "When each control is completed normally".)

## [1] Stop process

| Stop cause                          |                                                                                                  | Stop axis | M code ON signal after stop | Axis operation status (Md.26) after stopping | Stop process                                                                            |                  |                           |                                |                        |                                  |

| Intentional stop (Stop group 3)     | "Stop signal" ON from external source<br>"Axis stop signal" ON from CPU module                   | Each axis | No change                   | Stopped (Standby)                            |                                                                                         |                  |                           |                                |                        |                                  |

## [2] Types of stop processes

The operation can be stopped with deceleration stop, sudden stop or immediate stop.

### (1) Deceleration stop \*1

The operation stops with "deceleration time 0 to 3"

(**Pr.10**, **Pr.28**, **Pr.29**, **Pr.30**).

Which time from "deceleration time 0 to 3" to use for control is set in positioning data (**Da.4**).

### (2) Sudden stop

The operation stops with " **Pr.36** Sudden stop deceleration time".

### (3) Immediate stop

The operation does not decelerate.

The QD75 immediately stops the pulse output, but the operation will coast for the droop pulses accumulated in the drive unit's deviation counter.

Fig. 6.15 Types of stop processes

## REMARK

\*1 "Deceleration stop" and "sudden stop" are selected with the details parameter 2 "stop group 1 to 3 sudden stop selection". (The default setting is "deceleration stop".)

## [3] Order of priority for stop process

The order of priority for the QD75 stop process is as follows.

Deceleration stop < Sudden stop < Immediate stop

- (1) If the deceleration stop command ON (stop signal ON) or deceleration stop cause occurs during deceleration to speed 0 (including automatic deceleration), operation changes depending on the setting of " Cd.42 Stop command processing for deceleration stop selection".
  - (a) Manual control  
Independently of the Cd.42 setting, a deceleration curve is re-processed from the speed at stop cause occurrence.
  - (b) OPR control, positioning control
    - When Cd.42 = 0 (deceleration curve re-processing):  
A deceleration curve is re-processed from the speed at stop cause occurrence.
    - When Cd.42 = 1 (deceleration curve continuation):  
The current deceleration curve is continued after stop cause occurrence.  
(For details, refer to "Section 12.7.9 Stop command processing for deceleration stop function".)
- (2) If the stop signal ON or stop cause specified for a sudden stop occurs during deceleration, sudden stop process will start at that point.  
However, if the sudden stop deceleration time is longer than the deceleration time, the deceleration stop process will be continued even if a sudden stop cause occurs during the deceleration stop process.

## Example

The process when a sudden stop cause occurs during deceleration stop is shown below.

- (3) Operation will stop immediately if the target reaches the positioning address specified in the currently executed positioning data during deceleration of position control.

# CHAPTER 7 MEMORY CONFIGURATION AND DATA PROCESS

The QD75 memory configuration and data transmission are explained in this chapter.

The QD75 is configured of two memories. By understanding the configuration and roles of two memories, the QD75 internal data transmission process, such as "when the power is turned ON" or "when the PLC READY signal changes from OFF to ON" can be easily understood. This also allows the transmission process to be carried out correctly when saving or changing the data.

|-------|----------------------------------------------|----|---|
| 7.1   | Configuration and roles of QD75 memory.....  | 7- | 2 |
| 7.1.1 | Configuration and roles of QD75 memory ..... | 7- | 2 |
| 7.1.2 | Buffer memory area configuration.....        | 7- | 5 |
| 7.2   | Data transmission process.....               | 7- | 6 |

## 7.1 Configuration and roles of QD75 memory

## 7.1.1 Configuration and roles of QD75 memory

The QD75 is configured of the following two memories.

| Memory configuration | Role                                                                      | Area configuration |                   |                   |                                         |                                            |                   | Backup       |
|----------------------|---------------------------------------------------------------------------|--------------------|-------------------|-------------------|-----------------------------------------|--------------------------------------------|-------------------|--------------|
|                      |                                                                           | Parameter area     | Monitor data area | Control data area | Positioning data area<br>(No. 1 to 600) | Block start data area<br>(No.7000 to 7004) | PLC CPU memo area |              |
| • Buffer memory      | Area that can be directly accessed with sequence program from CPU module. | ○                  | ○                 | ○                 | ○                                       | ○                                          | ○                 | Not possible |
| • Flash ROM          | Area for backing up data required for positioning.                        | ○                  | —                 | —                 | ○                                       | ○                                          | —                 | Possible     |

○ : Setting and storage area provided, Not possible: Data is lost when power is turned OFF

— : Setting and storage area not provided, Possible: Data is held even when power is turned OFF

**■ Details of areas**

- Parameter area  
Area where parameters, such as positioning parameters and OPR parameters, required for positioning control are set and stored.  
(Set the items indicated with Pr.1 to Pr.57, Pr.70, and Pr.150 for each axis.)
- Monitor data area  
Area where positioning system or QD75 operation state is stored.  
(Set the items indicated with Md.1 to Md.48, Md.50 to Md.52 \*1.)  
\*1: Md.50 to Md.52 are for the QD75P□N/QD75D□N only.
- Control data area  
Area where data for operating and controlling positioning system is set and stored. (Set the items indicated with Cd.1 to Cd.42.)
- Positioning data area (No.1 to 600)  
Area where positioning data No.1 to 600 is set and stored.  
(Set the items indicated with Da.1 to Da.10 and Da.27 to Da.29 for each positioning data.)
- Block start data area (No.7000 to 7004)  
Area where information required only when carrying out block No. 7000 to 7004 high-level positioning is set and stored. (Set the items indicated with Da.11 to Da.19.)
- PLC CPU memo area  
Area where condition judgment values required for special positioning, etc., are set and stored.

## 7.1.2 Buffer memory area configuration

The QD75 buffer memory is configured of the following types of areas.

| Buffer memory area configuration    |                             | Buffer memory address*1      |                 |                    |                    | Writing possibility |
|-------------------------------------|-----------------------------|------------------------------|-----------------|--------------------|--------------------|---------------------|
|                                     |                             | Axis 1                       | Axis 2          | Axis 3             | Axis 4             |                     |
| Parameter area                      | Basic parameter area        | 0 to 15                      | 150 to 165      | 300 to 315         | 450 to 465         | Possible            |
|                                     | Detailed parameter area     | 17 to 62                     | 167 to 212      | 317 to 362         | 467 to 512         |                     |
|                                     |                             | 140*2                        |                 |                    |                    |                     |
|                                     | OPR basic parameter area    | 70 to 78                     | 220 to 228      | 370 to 378         | 520 to 528         |                     |
|                                     | OPR detailed parameter area | 79 to 89                     | 229 to 239      | 379 to 389         | 529 to 539         |                     |
| Monitor data area                   | System monitor area         | 1200 to 1425, 1440 to 1487*2 |                 |                    |                    | Not possible        |
|                                     | Axis monitor area           | 800 to 847, 899              | 900 to 947, 999 | 1000 to 1047, 1099 | 1100 to 1147, 1199 |                     |

|                                     |                             | 26850 to 26899               | 27850 to 27899  | 28850 to 28899     | 29850 to 29899     |                     |
|                                     | Condition data area         | 26900 to 26999               | 27900 to 27999  | 28900 to 28999     | 29900 to 29999     |                     |
| PLC CPU memo area                   | PLC CPU memo area           | 30000 to 30099               |                 |                    |                    | Possible            |

\*1: Use of address Nos. skipped above is prohibited. If used, the system may not operate correctly.

\*2: These addresses are not used for the QD75P□/QD75D□.

## 7.2 Data transmission process

The data is transmitted between the QD75 memories with steps (1) to (8) shown below.

\*The data transmission patterns numbered (1) to (8) on the right page correspond to the numbers (1) to (8) on the left page.

- (1) Transmitting data when power is turned ON or CPU module is reset (  )

When the power is turned ON or the CPU module is reset, the "parameters", "positioning data" and "block start data" stored (backed up) in the flash ROM is transmitted to the buffer memory.

- (2) Transmitting data with TO instruction from CPU module (  )

The parameters or data is written from the CPU module to the buffer memory using the TO instruction. At this time, when the "parameter area (b) \*1", "positioning data (No. 1 to 600)", "block start data (No. 7000 to 7004)", "control data" and "PLC CPU memo area" are written into the buffer memory with the TO instruction, it is simultaneously valid.

\*1 Parameter area (b) ..... Parameters validated with the next each positioning control is started.

( Pr.8 to Pr.10, Pr.25 to Pr.42 )

- (3) Validate parameters when PLC READY signal [Y0] changes from OFF to ON

When the PLC READY signal [Y0] changes from OFF to ON, the data stored in the buffer memory's "parameter area (a) \*2" is validated.

For Pr.5, however, only the data obtained first after the PLC READY signal [Y0] changes from OFF to ON when the power is turned ON or CPU module is reset becomes validate.

(Refer to Section 5.2 "List of parameters" for details.)

\*2: Parameter area (a) .... Parameters validated when PLC READY signal [Y0] changes from OFF to ON.

( Pr.1 to Pr.7, Pr.11 to Pr.24, Pr.43 to Pr.57, Pr.70, Pr.150 )

#### POINT

The setting values of the parameters that correspond to parameter area (b) are valid when written into the buffer memory with the TO instruction.  
However, the setting values of the parameters that correspond to parameter area (a) are not validated until the PLC READY signal [Y0] changes from OFF to ON.

- (4) Accessing with FROM instruction from CPU module (  )

The data is read from the buffer memory to the CPU module using the FROM instruction.

(5) Flash ROM write (  )

The following transmission process is carried out by setting "1" in " Cd.1 Flash ROM write request" (buffer memory [1900]).

- 1) The "parameters", "positioning data (No. 1 to 600)" and "block start data (No. 7000 to 7004)" in the buffer memory area are transmitted to the flash ROM. The writing to the flash ROM may also be carried out using a dedicated instruction "ZP.PFWRT". (Refer to CHAPTER 14 "DEDICATED INSTRUCTIONS" for details.)

(6) Flash ROM request (writing) (  )

The following transmission processes are carried out with the [flash ROM request] (write) from the peripheral device.

- 1) The "parameters", "positioning data (No. 1 to 600)" and "block start data (No. 7000 to 7004)" in the buffer memory area are transmitted to the flash ROM.

Note) This transmission process is the same as (5) above.

**IMPORTANT**

- (1) Do not turn the power OFF or reset the CPU module while writing to the flash ROM. If the power is turned OFF or the CPU module is reset to forcibly end the process, the data backed up in the flash ROM will be lost.
- (2) Do not write the data to the buffer memory before writing to the flash ROM is completed.
- (3) The number of writes to the flash ROM with the programmable controller program is 25 max. while the power is turned ON. Writing to the flash ROM beyond 25 times will cause the error "Flash ROM write number error" (error code: 805). Refer to Section 15.3 "List of errors" for details.

## (7) Reading data from buffer memory to peripheral device (⇨)

The following transmission processes are carried out with the [Read from module] from the peripheral device.

- 1) The "parameters", "positioning data (No. 1 to 600)" and "block start data (No. 7000 to 7004)" in the buffer memory area are transmitted to the peripheral device via the CPU module.

The following transmission processes are carried out with the [monitor] from the peripheral device.

- 2) The "monitor data" in the buffer memory area is transmitted to the peripheral device via the CPU module.

## (8) Writing data from peripheral device to buffer memory (⇨)

The following transmission processes are carried out with the [Write to module] from the peripheral device.

- 1) The "parameters", "positioning data (No. 1 to 600)" and "block start data (No. 7000 to 7004)" in the peripheral device area transmitted to the buffer memory via the CPU module.

At this time, when [Flash ROM write] is set with the peripheral device, the transmission processes indicated with the following are carried out.

- (5) Flash ROM write

The data transmission is carried out as shown in the previous pages, but the main method of using this data process is shown below.

(Ex.) Setting the positioning data

The following methods can be used to set the positioning data.

## PART 2 CONTROL DETAILS AND SETTING

PART 2 is configured for the following purposes (1) to (3).

- (1) To understand the operation and restrictions of each control.
- (2) To carry out the required settings in each control.
- (3) To deal with errors.

The required settings in each control include parameter setting, positioning data setting, control data setting by a sequence program, etc.

Carry out these settings while referring to CHAPTER 5 "DATA USED FOR POSITIONING CONTROL".

Also refer to CHAPTER 6 "SEQUENCE PROGRAMS USED FOR POSITIONING CONTROL" when creating the programs required in each control, and consider the entire control program configuration when creating each program.

# MEMO

[illegible]

# CHAPTER 8 OPR CONTROL

The details and usage of "OPR control" are explained in this chapter.

OPR control includes "machine OPR" that establish a machine OP without using address data, and "fast OPR" that store the coordinates established by the machine OPR, and carry out positioning to that position.

OPR carried out by sequence programs from the CPU module are explained in this chapter.

Refer to GX Configurator-QP Operating Manual for details on OPR using the peripheral device.

| 8.3.1 | Outline of the fast OPR operation .....     | 8- 23 |

## 8.1 Outline of OPR control

### 8.1.1 Two types of OPR control

In "OPR control" a position is established as the starting point (or "OP") when carrying out positioning control, and positioning is carried out toward that starting point.

It is used to return a machine system at any position other than the OP to the OP when the QD75 issues a "OPR request"\* with the power turned ON or others, or after a positioning stop.

In the QD75, the two types of controls shown below are defined as "OPR control", following the flow of the OPR work.

These two types of OPR control can be executed by setting the "OPR parameters", setting "Positioning start No. 9001" and "Positioning start No. 9002" prepared beforehand in the QD75 to "[Cd.3] Positioning start No.", and turning ON the positioning start signal.

The ZP.PSTRT ☐ start numbers of the dedicated instruction can also be set to 9001 or 9002 to execute the OPR control. (For details, refer to CHAPTER 14 "DEDICATED INSTRUCTIONS".)

- (1) Establish a positioning control OP
  - "Machine OPR" (positioning start No. 9001)
- (2) Carry out positioning toward the OP
  - "Fast OPR" (positioning start No. 9002).

\* The "machine OPR" in (1) above must always be carried out before executing the "fast OPR" in (2).

|        |
|--------|
| REMARK |
|--------|

#### OPR request \*

The "OPR request flag" ([Md.31] Status: b3) must be turned ON in the QD75, and a machine OPR must be executed in the following cases.

- When the power is turned ON
- At the ON → OFF of the drive unit READY signal ([Md.30] External input/output signal: b2).
- At the OFF → ON of the PLC READY signal [Y0]

The address information stored in the QD75 cannot be guaranteed while the "OPR request flag" is ON.

The "OPR request flag" turns OFF and the "OPR complete flag" ([Md.31] Status: b4) turns ON if the machine OPR is executed and is completed normally.

### ■ OPR sub functions

Refer to Section 3.2.4 "Combination of QD75 main functions and sub functions" for details on "sub functions" that can be combined with OPR control. Also refer to CHAPTER 12 "CONTROL SUB FUNCTIONS" for details on each sub function.

#### [Remarks]

The following two sub functions are only related to machine OPR.

| Sub function name  | Machine OPR | Fast OPR | Reference      |
|--------------------|-------------|----------|----------------|
| OPR retry function | △           | ×        | Section 12.2.1 |
| OP shift function  | ○           | ×        | Section 12.2.2 |

○ : Combination possible, △: Restricted, ×: Combination not possible

### ■ When an OPR is not required

Control can be carried out ignoring the "OPR request flag" (**[Md.31]** Status: b3) in systems that do not require an OPR.

In this case, the "OPR parameters (**[Pr.43]** to **[Pr.57]**)" must all be set to their initial values or a value at which an error does not occur.

### ■ OPR from peripheral devices

"Machine OPR" and "fast OPR" can be executed from the test mode of the peripheral device.

Refer to GX Configurator-QP Operating Manual for details on OPR from the peripheral device.

## 8.2 Machine OPR

### 8.2.1 Outline of the machine OPR operation

#### Important

Use the OPR retry function when the OP position is not always in the same direction from the workpiece operation area (when the OP is not set near the upper or lower limit of the machine).

\*The machine OPR may not complete unless the OPR retry function is used.

#### Machine OPR operation

In a machine OPR, a machine OP is established.

None of the address information stored in the QD75, CPU module, or servo is used at this time. The position mechanically established after the machine OPR is regarded as the "OP" to be the starting point for positioning control.

The method for establishing an "OP" by a machine OPR differs according to the method set in "Pr.43 OPR method".

The following shows the operation when starting a machine OPR.

|    |                                                                                                                                                                                     |
|----|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 1) | The machine OPR is started.                                                                                                                                                         |
| 2) | The operation starts according to the speed and direction set in the OPR parameters (Pr.43 to Pr.57).                                                                               |
| 3) | The "OP" is established by the method set in "Pr.43 OPR method", and the machine stops. (Refer to Sections 8.2.2 to 8.2.8)                                                          |
| 4) | If "a" is set as "Pr.45 OP address", "a" will be stored as the current position in the "Md.20 Current feed value" and "Md.21 Machine feed value" which are monitoring the position. |
| 5) | The machine OPR is completed.                                                                                                                                                       |

\* The "Pr.45 OP address" is a fixed value set by the user.

Fig. 8.1 Example of a machine OPR

## 8.2.2 Machine OPR method

The method by which the machine OP is established (method for judging the OP position and machine OPR completion) is designated in the machine OPR according to the configuration and application of the positioning method.

The following table shows the six methods that can be used for this OPR method.

(The OPR method is one of the items set in the OPR parameters. It is set in "Pr.43 OPR method" of the basic parameters for OPR.)

| Pr.43 OPR method      | Operation details                                                                                                                                                                                                                                                                                                                                                                                                |
|-----------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Near-point dog method | Deceleration starts by the OFF → ON of the near-point dog. (Speed is reduced to "Pr.47 Creep speed".)<br>The operation stops at the first zero signal* after the near-point dog turns from ON → OFF. When a "deviation counter clear output" is completed, the machine OPR is completed.                                                                                                                         |
| Stopper method 1)     | The stopper position is regarded as the OP.<br>After the deceleration starts by the OFF → ON of the near-point dog, the machine presses against the stopper at the "Pr.47 Creep speed" and stops.<br>The machine OPR is regarded as completed on completion of the deviation counter clear output provided after "Pr.49 OPR dwell time" passed after stoppage.                                                   |
| Stopper method 2)     | The stopper position is regarded as the OP.<br>After the deceleration starts by the OFF → ON of the near-point dog, the machine presses against the stopper at the "Pr.47 Creep speed" and stops.<br>The machine OPR is regarded as completed on completion of the deviation counter clear output provided after the zero signal* is detected after stoppage.                                                    |
| Stopper method 3)     | The stopper position is regarded as the OP.<br>The machine starts at the "Pr.47 Creep speed" from the beginning, then presses against the stopper at the "Pr.47 Creep speed" and stops.<br>The machine OPR is regarded as completed on completion of the deviation counter clear output provided after the zero signal* is detected after stoppage.                                                              |
| Count method 1)       | The deceleration starts by the OFF → ON of the near-point dog, and the machine moves at the "Pr.47 Creep speed".<br>The machine stops at the zero signal* after moving the distance set in the "Pr.50 Setting for the movement amount after near-point dog ON" from the near point dog OFF → ON position. When a "deviation counter clear signal output" is completed, the machine OPR is regarded as completed. |
| Count method 2)       | The deceleration starts by the OFF → ON of the near-point dog, and the machine moves at the "Pr.47 Creep speed".<br>The machine moves the distance set in the "Pr.50 Setting for the movement amount after near-point dog ON" from the near point dog OFF → ON position, and stops at that position. The machine OPR is then regarded as completed.                                                              |

\*: The following are the signals input as the zero signals of the QD75 in the corresponding OPR methods.

Near-point dog method, count method 1): Signal that is output as a single pulse at one motor revolution (e.g. Z-phase signal output from the drive unit)

Stopper method 2), 3) : Signal that is output on detection of contact with the stopper. (Input externally)

The following shows the external I/O signals used for machine OPR.

| Pr.43 OPR method      | Signal required for control |             |                            |                                | Torque limit |
|-----------------------|-----------------------------|-------------|----------------------------|--------------------------------|--------------|
|                       | Near-point dog              | Zero signal | Upper/lower limit switches | Deviation counter clear output |              |
| Near-point dog method | ◎                           | ◎           | ○                          | ◎                              | —            |
| Stopper method 1)     | ◎                           | —           | ○                          | ◎                              | ◎            |
| Stopper method 2)     | ◎                           | ◎           | ○                          | ◎                              | ◎            |
| Stopper method 3)     | —                           | ◎           | ○                          | ◎                              | ◎            |
| Count method 1)       | ◎                           | ◎           | ○                          | ◎                              | —            |
| Count method 2)       | ◎                           | —           | ○                          | —                              | —            |

◎: Necessary ○: Necessary as required -: Unnecessary

### REMARK

#### Creep speed

The stopping accuracy is poor when the machine suddenly stops from fast speeds. To improve the machine's stopping accuracy, its must change over to a slow speed before stopping. This speed is set in the " Pr.47 Creep speed".

## 8.2.3 OPR method (1): Near-point dog method

The following shows an operation outline of the "near-point dog method" OPR method.

■ Operation chart

|    |                                                                                                                                                                                                                                                                       |
|----|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 1) | The machine OPR is started.<br>(The machine begins the acceleration designated in " [Pr.51] OPR acceleration time selection", in the direction designated in " [Pr.44] OPR direction". It then moves at the " [Pr.46] OPR speed" when the acceleration is completed.) |
| 2) | The machine begins decelerating when the near-point dog ON is detected.                                                                                                                                                                                               |
| 3) | The machine decelerates to the " [Pr.47] Creep speed", and subsequently moves at that speed.<br>(At this time, the near-point dog must be ON. The workpiece will continue decelerating and stop if the near-point dog is OFF.)                                        |
| 4) | After the near-point dog turns OFF, the pulse output from the QD75 will stop at the first zero signal, outputting a "deviation counter clear signal" to the drive unit.<br>(The "deviation counter clear signal output time" is set in [Pr.55].)                      |
| 5) | After a "deviation counter clear signal" is output to the drive unit, the OPR complete flag ( [Md.31] Status: b4) turns from OFF to ON and the OPR request flag ( [Md.31] Status: b3) turns from ON to OFF.                                                           |

Fig. 8.2 Near-point dog method machine OPR

### ■ Restrictions

A pulse generator with a zero signal is required.

When using a pulse generator without a zero signal, generate a zero signal using an external signal.

### ■ Precautions during operation

- (1) An error "Start at OP (error code: 201)" will occur if another machine OPR is attempted after a machine OPR completion when the OPR retry function is not set ("0" is set in "Pr.48 OPR retry").
  - (2) Machine OPR carried out from the near-point dog ON position will start at the "Pr.47 Creep speed".
  - (3) The near-point dog must be ON during deceleration from the OPR speed "Pr.47 Creep speed".
- \* The workpiece will continue decelerating and stop if the near-point dog is turned OFF before it has decelerated to the creep speed, thus causing an error "Dog detection timing fault" (error code: 203).

Fig. 8.3 Operation when the near-point dog is turned OFF before the creep speed is reached

- (4) When a machine OPR is stopped with the stop signal, perform a machine OPR again. If the restart command is turned ON after a stop with the stop signal, an error "OPR restart not possible" (error code: 209) occurs.

## 8.2.4 OPR method (2): Stopper method 1)

The following shows an operation outline of the "stopper method 1)" OPR method.

■ Operation chart

|    |                                                                                                                                                                                                                                                                         |
|----|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 1) | The machine OPR is started.<br>(The machine begins the acceleration designated in "[Pr.51] OPR acceleration time selection", in the direction designated in "[Pr.44] OPR direction". It then moves at the "[Pr.46] OPR speed" when the acceleration is completed.)      |
| 2) | The machine begins decelerating when the near-point dog ON is detected.                                                                                                                                                                                                 |
| 3) | The machine decelerates to the "[Pr.47] Creep speed", and subsequently moves at that speed.<br>(Torque limiting is required at this time. If the torque is not limited, the servomotor may fail in step 4).)                                                            |
| 4) | The machine presses against the stopper at the creep speed and stops.                                                                                                                                                                                                   |
| 5) | The pulse output from the QD75 will stop when the "[Pr.49] OPR dwell time" has elapsed after the near-point dog turns ON, outputting the "deviation counter clear output" to the drive unit.<br>(A "deviation counter clear signal output time" is set in the [Pr.55].) |
| 6) | After a "deviation counter clear output" is output to the drive unit, the OPR complete flag ([Md.31] Status: b4) turns from OFF to ON, and the OPR request flag ([Md.31] Status: b3) turns from ON to OFF.                                                              |

Fig. 8.4 Stopper method 1) machine OPR

### ■ Restrictions

Always limit the servomotor torque after the "[Pr.47] Creep speed" is reached. If the torque is not limited, the servomotor may fail when the machine presses against the stopper. (Refer to Section 12.4.2 "Torque limit function".)

### ■ Precautions during operation

- (1) Set a value in the "[Pr.49] OPR dwell time" that is equal to or higher than the movement time from the near-point dog ON to the time the machine presses against the stopper.
- (2) The workpiece will continue decelerating and stop if the "[Pr.49] OPR dwell time" elapses during deceleration from the "[Pr.46] OPR speed", thus causing an error "Dwell time fault" (error code: 205).

Fig. 8.5 Operation when the dwell time elapses during deceleration from the OPR speed

- (3) If the "Pr.49 OPR dwell time" elapses before the stop at the stopper, the workpiece will stop at that position, and that position will be regarded as the OP. At this time, an error will not occur.

Fig. 8.6 Operation when the dwell time elapses before the stop at the stopper

- (4) The near-point dog must be turned ON until it presses against the stopper. If any range that the near-point is turned OFF exists until it presses against the stopper, executing the machine OPR from the area leads it to be pressed against the stopper at OPR speed.
- (5) Machine OPR started while the near-point dog is ON will start at the "Pr.47 Creep speed".
- (6) When a machine OPR is stopped with the stop signal, perform a machine OPR again. If the restart command is turned ON after a stop with the stop signal, an error "OPR restart not possible" (error code: 209) occurs.

## 8.2.5 OPR method (3): Stopper method 2)

The following shows an operation outline of the "stopper method 2)" OPR method.

■ Operation chart

|    |                                                                                                                                                                                                                                                                       |
|----|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 1) | The machine OPR is started.<br>(The machine begins the acceleration designated in " [Pr.51] OPR acceleration time selection", in the direction designated in " [Pr.44] OPR direction". It then moves at the " [Pr.46] OPR speed" when the acceleration is completed.) |
| 2) | The machine begins decelerating when the near-point dog ON is detected.                                                                                                                                                                                               |
| 3) | The machine decelerates to the " [Pr.47] Creep speed", and subsequently moves at that speed.<br>(Torque limiting is required at this time. If the torque is not limited, the servomotor may fail in step 4).)                                                         |
| 4) | The machine presses against the stopper at the creep speed and stops.                                                                                                                                                                                                 |
| 5) | The pulse output from the QD75 will stop at the zero signal after the machine stops, outputting the "deviation counter clear output" to the drive unit.<br>(A "deviation counter clear signal output time" is set in the [Pr.55].)                                    |
| 6) | After a "deviation counter clear output" is output to the drive unit, the OPR complete flag ( [Md.31] Status: b4) turns from OFF to ON, and the OPR request flag ( [Md.31] Status: b3) turns from ON to OFF.                                                          |

Fig. 8.7 Stopper method 2) machine OPR

### ■ Restrictions

- (1) Always limit the servomotor torque after the " **Pr.47** Creep speed" is reached. If the torque is not limited, the servomotor may fail when the machine presses against the stopper. (Refer to Section 12.4.2 "Torque limit function".)
- (2) Use an external input signal as the zero signal.

### ■ Precautions during operation

- (1) Input a zero signal from an external source after the machine presses against the stopper.  
The workpiece will continue decelerating and stop if a zero signal is input before deceleration to the " **Pr.47** Creep speed". An error "OP detection timing fault" (error code: 204) will occur after the machine stops.

Fig. 8.8 Operation when a zero signal is input before the creep speed is reached

- (2) If the zero signal is input before the workpiece stops at the stopper, the workpiece will stop at that position, and that position will be regarded as the OP.

Fig. 8.9 Operation when the zero signal is input before the stop at the stopper

- (3) The near-point dog must be turned ON until it presses against the stopper. If any range that the near-point is turned OFF exists until it presses against the stopper, executing the machine OPR from the area leads it to be pressed against the stopper at ORR speed.
- (4) Machine OPR started while the near-point dog is ON will start at the " [Pr.47] Creep speed".
- (5) When a machine OPR is stopped with the stop signal, perform a machine OPR again. If the restart command is turned ON after a stop with the stop signal, an error "OPR restart not possible" (error code: 209) occurs.

## 8.2.6 OPR method (4): Stopper method 3)

The following shows an operation outline of the "stopper method 3)" OPR method.  
 The "stopper method 3)" method is effective when a near-point dog has not been installed.  
 (Note that the operation is carried out from the start at the "Pr.47 Creep speed", so it will take some time until the machine OPR completion.)

## ■ Operation chart

|    |                                                                                                                                                                                                                                                                                              |
|----|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 1) | The machine OPR is started.<br>(The machine moves at the "Pr.47 Creep speed", in the direction designated in "Pr.44 OPR direction". Torque limiting is required at this time. If the torque is not limited, the servomotor may fail when the machine presses against the stopper in step 2.) |
| 2) | The machine presses against the stopper at the "Pr.47 Creep speed" and stops.                                                                                                                                                                                                                |
| 3) | The pulse output from the QD75 will stop at the zero signal after the machine stops, outputting the "deviation counter clear output" to the drive unit.<br>(A "deviation counter clear signal output time" is set in the Pr.55.)                                                             |
| 4) | After a "deviation counter clear output" is output to the drive unit, the OPR complete flag (Md.31 Status: b4) turns from OFF to ON, and the OPR request flag (Md.31 Status: b3) turns from ON to OFF.                                                                                       |

Fig. 8.10 Stopper method 3) machine OPR

### ■ Restrictions

- (1) Always limit the servomotor torque after the "[Pr.47] Creep speed" is reached. If the torque is not limited, the servomotor may fail when the machine presses against the stopper. (Refer to Section 12.4.2 "Torque limit function".)
- (2) Use an external input signal as the zero signal.
- (3) The OPR retry function cannot be used in "stopper stop method 3)".

### ■ Precautions during operation

- (1) If the zero signal is input before the workpiece stops at the stopper, the workpiece will stop at that position, and that position will become the OP. At this time an error will not occur.

Fig. 8.11 When the zero signal is input before the stop at the stopper

- (2) When a machine OPR is stopped with the stop signal, perform a machine OPR again. If the restart command is turned ON after a stop with the stop signal, an error "OPR restart not possible" (error code: 209) occurs.

## 8.2.7 OPR method (5): Count method1)

The following shows an operation outline of the "count method 1)" OPR method. In the "count method 1)", machine OPR can be performed even in the following situations:

- when near-point dog is ON
- after completion of a machine OPR

■ Operation chart

|    |                                                                                                                                                                                                                                                                                                                                                                            |
|----|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 1) | The machine OPR is started.<br>(The machine begins the acceleration designated in " [Pr.51] OPR acceleration time selection", in the direction designated in " [Pr.44] OPR direction". It then moves at the " [Pr.46] OPR speed" when the acceleration is completed.)                                                                                                      |
| 2) | The machine begins decelerating when the near-point dog ON is detected.                                                                                                                                                                                                                                                                                                    |
| 3) | The machine decelerates to the " [Pr.47] Creep speed", and subsequently moves at that speed.                                                                                                                                                                                                                                                                               |
| 4) | On detection of the first zero signal after the axis has traveled the movement amount set in " [Pr.50] Setting for the movement amount after near-point dog ON" after near-point dog ON, the pulse output from the QD75 stops and the "deviation counter clear output" is output to the drive unit.<br>(A "deviation counter clear signal output time" is set in [Pr.55].) |
| 5) | After a "deviation counter clear output" is output to the drive unit, the OPR complete flag [Md.31] Status: b4) turns from OFF to ON, and the OPR request flag ([Md.31] Status: b3) turns from ON to OFF.                                                                                                                                                                  |

Fig. 8.12 Count method1) machine OPR

### ■ Restrictions

A pulse generator with a zero signal is required.

When using a pulse generator without a zero signal, generate a zero signal using an external signal.

### ■ Precautions during operation

- (1) An error "Count method movement amount fault" (error code: 206) will occur and the operation will not start if the " [Pr.50] Setting for the movement amount after near-point dog ON" is smaller than the deceleration distance from the " [Pr.46] OPR speed" to " [Pr.47] Creep speed".
- (2) If the speed is changed to a speed faster than " [Pr.46] OPR speed" by the speed change function (refer to "12.5.1 Speed change function".) during a machine OPR, the distance to decelerate to " [Pr.47] Creep speed" may not be ensured, depending on the setting value of " [Pr.50] Setting for the movement amount after near-point dog ON". In this case, the error "Count method movement amount fault" (error code: 206) occurs and the Machine OPR is stopped.
- (3) The following shows the operation when a machine OPR is started while the near-point dog is ON.

Fig. 8.13 Count method 1) machine OPR on the near-point dog ON position

- (4) Turn OFF the near-point dog at a sufficient distance from the OP.  
Although there is no harm in operation if the near-point dog is turned OFF during a machine OPR, it is recommended to leave a sufficient distance from the OP when the near-point dog is turned OFF for the following reason.  
If machine OPRs are performed consecutively after the near-point dog is turned OFF at the time of machine OPR completion, operation will be performed at the OPR speed until the hardware stroke limit (upper/lower limit) is reached.  
If a sufficient distance cannot be kept, consider the use of the OPR retry function.
- (5) When a machine OPR is stopped with the stop signal, perform a machine OPR again.  
If the restart command is turned ON after a stop with the stop signal, an error "OPR restart not possible" (error code: 209) occurs.

## 8.2.8 OPR method (6): Count method 2)

The following shows an operation outline of the "method 2)" OPR method.

The "count method 2)" method is effective when a "zero signal" cannot be received. (Note that compared to the "count method 1)" method, using this method will result in more deviation in the stop position during machine OPR.)

In the "count method 2)", as well as in the "count method 1)", machine OPR can be performed even in the following situations:

- when near-point dog is ON
- after completion of a machine OPR

#### ■ Operation chart

Fig. 8.14 Count method 2) machine OPR

### ■ Restrictions

When this method is used, a deviation will occur in the stop position (OP) compared to other OPR methods because an error of about 1ms occurs in taking in the near-point dog ON.

### ■ Precautions during operation

- (1) An error "Count method movement amount fault" (error code: 206) will occur and the operation will not start if the " [Pr.50] Setting for the movement amount after near-point dog ON" is smaller than the deceleration distance from the " [Pr.46] OPR speed" to " [Pr.47] Creep speed".
- (2) If the speed is changed to a speed faster than " [Pr.46] OPR speed" by the speed change function (refer to Section 12.5.1 "Speed change function".) during a machine OPR, the distance to decelerate to " [Pr.47] Creep speed" may not be ensured, depending on the setting value of " [Pr.50] Setting for the movement amount after near-point dog ON". In this case, the error "Count method movement amount fault" (error code: 206) occurs and the Machine OPR is stopped.
- (3) The following shows the operation when a machine OPR is started while the near-point dog is ON.

Fig. 8.15 Count method 2) machine OPR on the near-point dog ON position

- (4) Turn OFF the near-point dog at a sufficient distance from the OP.  
Although there is no harm in operation if the near-point dog is turned OFF during a machine OPR, it is recommended to leave a sufficient distance from the OP when the near-point dog is turned OFF for the following reason.  
If machine OPRs are performed consecutively after the near-point dog is turned OFF at the time of machine OPR completion, operation will be performed at the OPR speed until the hardware stroke limit (upper/lower limit) is reached.  
If a sufficient distance cannot be kept, consider the use of the OPR retry function.

- (5) When a machine OPR is stopped with the stop signal, perform a machine OPR again.

If the restart command is turned ON after a stop with the stop signal, an error "OPR restart not possible" (error code: 209) occurs.

### 8.3 Fast OPR

#### 8.3.1 Outline of the fast OPR operation

##### ■ Fast OPR operation

After establishing OP position by a machine OPR, positioning control to the OP position is executed without using a near-point dog or a zero signal. The following shows the operation during a fast OPR start.

- 1) The fast OPR is started.
- 2) Positioning control to the OP position established by a machine OPR begins at the speed set in the OPR parameters (Pr.43 to Pr.57).
- 3) The fast OPR is completed.

Fig. 8.16 Fast OPR

### ■ Operation timing and processing time of fast OPR

The following shows details about the operation timing and time during fast OPR.

Fig. 8.17 Operation timing and processing time of fast OPR

#### Normal timing time

| Model           | t1           | t2           | t3         |
|-----------------|--------------|--------------|------------|
| QD75P□N/QD75D□N | 0.2 to 1.1ms | 0.4 to 1.3ms | 0 to 0.9ms |
| QD75P□/QD75D□   | 1.0 to 1.3ms | 2.7 to 4.4ms | 0 to 1.8ms |

•The t1 timing time could be delayed by the operation state of other axes.

### ■ Operating restrictions

- (1) The fast OPR can only be executed after the OP position is established by executing the Machine OPR.  
If not, the error "OPR request ON" (error code: 207) will occur.  
(OPR request flag (Md.31 Status: b3) must be turned OFF.)
- (2) If the fraction pulse is cleared to zero using current value changing or fixed-feed control, execute the fast OPR and an error will occur by a cleared amount.
- (3) When unlimited length feed is executed by speed control and the current machine feed value overflows or underflows once, the fast OPR cannot be executed normally.
- (4) The OPR complete flag (Md.31 Status: b4) is not turned ON.
- (5) The axis operation status during fast OPR is "Position control".

# CHAPTER 9 MAJOR POSITIONING CONTROL

The details and usage of the major positioning controls (control functions using the "positioning data") are explained in this chapter.

The major positioning controls include such controls as "positioning control" in which positioning is carried out to a designated position using the address information, "speed control" in which a rotating object is controlled at a constant speed, "speed-position switching control" in which the operation is shifted from "speed control" to "position control" and "position-speed switching control" in which the operation is shifted from "position control" to "speed control".

Carry out the required settings to match each control.

## 9.1 Outline of major positioning controls

"Major positioning controls" are carried out using the "positioning data" stored in the QD75.

The basic controls such as position control and speed control are executed by setting the required items in this "positioning data", and then starting that positioning data.

The control system for the "major positioning controls" is set in setting item

" [Da.2] Control system" of the positioning data.

Control defined as a "major positioning control" carries out the following types of control according to the " [Da.2] Control system" setting.

| Major positioning control |                                         |                                       | [Da.2] Control system                                                              | Details                                                                                                                                                                                                                  |
|---------------------------|-----------------------------------------|---------------------------------------|------------------------------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Position control *        | Linear control                          | 1-axis linear control                 | ABS Linear 1<br>INC Linear 1                                                       | Positioning of a designated 1 axis is carried out from the start address (current stop position) to the designated position.                                                                                             |
|                           |                                         | 2-axis linear interpolation control * | ABS Linear 2<br>INC Linear 2                                                       | Using a designated 2 axes, linear interpolation control is carried out from the start address (current stop position) to the designated position.                                                                        |

|                                  | LOOP                   | LOOP                                                     | A repeat control is carried out by repeat LOOP to LEND.                                                                                                                                                                                                                                                                                                                                                    |
|                                  | LEND                   | LEND                                                     | Control is returned to the top of the repeat control by repeat LOOP to LEND. After the repeat operation is completed specified times, the next positioning data is run.                                                                                                                                                                                                                                    |

\* In "2-axis linear interpolation control", "3-axis linear interpolation control", "4-axis linear interpolation control", "2-axis fixed-feed control", "3-axis fixed-feed control", "4-axis fixed-feed control", "2-axis circular interpolation control", "3-axis helical interpolation control", "2-axis speed control", "3-axis speed control", and "4-axis speed control", control is carried out so that linear and arc paths are drawn using a motor set in two or more axis directions. This kind of control is called "interpolation control". (Refer to Section 9.1.6 "Interpolation control" for details.)

## 9.1.1 Data required for major positioning control

The following table shows an outline of the "positioning data" configuration and setting details required to carry out the "major positioning controls".

| Setting item           |                                                     | Setting details                                                                                                                                                                                                                         |
|------------------------|-----------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Positioning data No. 1 | <b>Da.1</b> Operation pattern                       | Set the method by which the continuous positioning data (Ex: positioning data No. 1, No. 2, No. 3) will be controlled. (Refer to Section 9.1.2.)                                                                                        |
|                        | <b>Da.2</b> Control system                          | Set the control system defined as a "major positioning control". (Refer to Section 9.1.)                                                                                                                                                |
|                        | <b>Da.3</b> Acceleration time No.                   | Select and set the acceleration time at control start. (Select one of the four values set in <b>Pr.9</b> , <b>Pr.25</b> , <b>Pr.26</b> , and <b>Pr.27</b> for the acceleration time.)                                                   |
|                        | <b>Da.4</b> Deceleration time No.                   | Select and set the deceleration time at control stop. (Select one of the four values set in <b>Pr.10</b> , <b>Pr.28</b> , <b>Pr.29</b> , and <b>Pr.30</b> for the deceleration time.)                                                   |
|                        | <b>Da.5</b> Axis to be interpolated                 | Set an axis to be interpolated (partner axis) during the 2-axis interpolation operation and a circular interpolation axis during the 3-axis helical interpolation control. (Refer to Section 9.1.6.)                                    |
|                        | <b>Da.6</b> Positioning address/movement amount     | Set the target value during position control. (Refer to Section 9.1.3.)                                                                                                                                                                 |
|                        | <b>Da.7</b> Arc address                             | Set the sub point or center point address during circular interpolation control.                                                                                                                                                        |
|                        | <b>Da.8</b> Command speed                           | Set the speed during the control execution.                                                                                                                                                                                             |
|                        | <b>Da.9</b> Dwell time                              | The time between the command pulse output is completed to the positioning completed signal is turned ON. Set it for absorbing the delay of the mechanical system to the instruction, such as the delay of the servo system (deviation). |
|                        | <b>Da.10</b> M code                                 | Set this item when carrying out sub work (clamp and drill stops, tool replacement, etc.) corresponding to the code No. related to the positioning data execution.                                                                       |
|                        | <b>Da.27</b> M code ON signal output timing         | Set the M code ON signal output timing for each positioning data.                                                                                                                                                                       |
|                        | <b>Da.28</b> ABS direction in degrees               | Set the ABS direction in degrees for each positioning data.                                                                                                                                                                             |
|                        | <b>Da.29</b> Interpolation speed designation method | Set the interpolation speed designation method for each positioning data.                                                                                                                                                               |

\* The settings and setting requirement for the setting details of **Da.1** to **Da.10** and **Da.27** to **Da.29** differ according to the "**Da.2** Control system". (Refer to Section 9.2 "Setting the positioning data".)

#### ■ Major positioning control sub functions

Refer to Section 3.2.4 "Combination of QD75 major functions and sub functions" for details on "sub functions" that can be combined with the major positioning control.

Also refer to CHAPTER 12 "CONTROL SUB FUNCTIONS" for details on each sub function.

#### ■ Major positioning control from peripheral devices

"Major positioning control" can be executed from the peripheral device test mode. Refer to GX Configurator-QP Operating Manual for details on carrying out major positioning control from the peripheral device.

#### REMARK

- 600 positioning data (positioning data No. 1 to 600) items can be set per axis.

## 9.1.2 Operation patterns of major positioning controls

In "major positioning control" (high-level positioning control), " Da.1 Operation pattern" can be set to designate whether to continue executing positioning data after the started positioning data. The "operation pattern" includes the following 3 types.

- Positioning complete — (1) Independent positioning control (operation pattern: 00)
- Positioning continue — (2) Continuous positioning control (operation pattern: 01)
- (3) Continuous path control (operation pattern: 11)

The following shows examples of operation patterns when "1-axis linear control (ABS linear 1)" is set in positioning data No. 1 to No. 6 of axis 1. Details of each operation pattern are shown on the following pages.

< Operation example when "1-axis linear positioning" is set in the positioning data of axis 1 >

(Setting details)

|                       |                                                 |                                                                                |              |
|-----------------------|-------------------------------------------------|--------------------------------------------------------------------------------|--------------|
| Positioning data No.1 | Positioning to address [A] at command speed [a] | Operation pattern = 11: Continuous path control                                | No.1 Start   |
| No.2                  | Positioning to address [B] at command speed [b] | Operation pattern = 11: Continuous path control                                |              |
| No.3                  | Positioning to address [C] at command speed [a] | Operation pattern = 01: Continuous positioning control                         |              |
| No.4                  | Positioning to address [D] at command speed [b] | Operation pattern = 01: Continuous positioning control                         |              |
| No.5                  | Positioning to address [E] at command speed [a] | Operation pattern = 00: Independent positioning control (Positioning complete) |              |
| No.6                  | Positioning to address [F] at command speed [a] | Operation pattern = 11: Continuous path control                                | Control stop |

For 1-axis linear control

(One motor is driven, and positioning is carried out to an addresses designated in one direction.)

## POINT

The BUSY signal [XC, XD, XE, XF] turns ON even when position control of movement amount 0 is executed. However, since the ON time is short, the ON status may not be detected in the sequence program.

[1] Independent positioning control (Positioning complete)

This control is set when executing only one designated data item of positioning. If a dwell time is designated, the positioning will complete after the designated time elapses.

This data (operation pattern [00] data) becomes the end of block data when carrying out block positioning. (The positioning stops after this data is executed.)

Fig. 9.1 Operation during independent positioning control

## [2] Continuous positioning control

- (1) The machine always automatically decelerates each time the positioning is completed. Acceleration is then carried out after the QD75 command speed reaches 0 to carry out the next positioning data operation. If a dwell time is designated, the acceleration is carried out after the designated time elapses.
- (2) In operation by continuous positioning control (operation pattern "01"), the next positioning No. is automatically executed. Always set operation pattern "00" in the last positioning data to complete the positioning.  
 If the operation pattern is set to positioning continue ("01" or "11"), the operation will continue until operation pattern "00" is found.  
 If the operation pattern "00" cannot be found, the operation may be carried out until the positioning data No. 600. If the operation pattern of the positioning data No. 600 is not completed, the operation will be started again from the positioning data No. 1.

Fig. 9.2 Operation during continuous positioning control

- (f) In continuous path control, the positioning may be completed before the set address/movement amount by the distance  $\Delta \ell$ , and the data may switch to the "positioning data that will run next".

The value of the distance  $\Delta \ell$  is as follows:

- QD75P□N/QD75D□N:  
 $0 \leq \Delta \ell < (\text{Moving distance in 0.9ms at the command speed})$
- QD75P□/QD75D□:  
 $0 \leq \Delta \ell < (\text{Moving distance in 1.8ms at the command speed})$

【Acceleration/deceleration (setting)】

【Acceleration/deceleration (actual one)】

The distance  $\Delta \ell$  is output when the next positioning data is running at the specified speed.

Therefore, the execution time of the next positioning data may be longer than the set execution time.\*1

If this causes a control problem, take one of the following measures.

- 1) Use the function "output timing selection of near pass control".  
 By selecting "At deceleration" as an output timing, the positioning execution time of the next positioning data remains the same as it was set. (Refer to Section 12.3.4 "Output timing selection of near pass control".)
- 2) Use the "speed change function".  
 Change speed using the speed change function instead of continuous path control. (Refer to Section 12.5.1 "Speed change function".)

\*1: When the command speed V1 of a positioning data and the command speed V2 of the next positioning data is different significantly, and  $V1 > V2$

For positioning data in which automatic deceleration is set, the positioning is completed at the set address. Therefore, in continuous path control, the address where a positioning is completed may be different from the set address. However, the address will be the specified one on completion of automatic deceleration for continuous positioning control (01) or positioning complete (00).

#### POINT

In the continuous path control, a speed variation will not occur using the near-pass function when the positioning data No. is switched (Refer to Section 12.3.3 "Near-pass function").

## (2) Deceleration stop conditions during continuous path control

Deceleration stops are basically not carried out in continuous path control, but the machine will carry out a deceleration stop to speed "0" in the following cases (a) to (c).

- (a) When the operation pattern of the positioning data currently being executed is "continuous path control: 11", and the movement direction of the positioning data currently being executed differs from that of the next positioning data. (Only for 1-axis positioning control (Refer to the "Point" in the next page.))

- (b) During operation by step operation.  
(Refer to Section 12.7.1 "Step function".)
- (c) When there is an error in the positioning data to carry out the next operation.

**POINTS**

- (1) The movement direction is not checked during interpolation operations. Thus, automatic deceleration to a stop will not be carried out even if the movement direction is changed (See the figures below). Because of this, the interpolation axis may suddenly reverse direction. To avoid this sudden direction reversal in the interpolation axis, set the pass point to continuous positioning control "01" instead of setting it to continuous path control "11".

- (2) When the interpolation axis reverses direction suddenly, the command pulses from QD75 are output as shown in the figure below.

The  $t_1$  and  $t_2$  are calculated using the following expressions, where a command frequency is  $f$  (pps).

$$t_1 = 1/2 f \text{ (s)} \quad t_2 = 1/f \text{ (s)}$$

A time of  $t_1$  must be maintained by the drive unit for a specified period  $T$  (s).

( $T$  depends on the drive unit specifications.)

If  $t_1$  cannot be maintained for  $T$  or longer, lower the " [Da.8] Command speed" of the positioning data.

- (3) When a "0" is set in the " [Da.6] Positioning address/movement amount" of the continuous path control positioning data, the command speed of about 0.9ms (QD75P□N/QD75D□N) or 2ms (QD75P□/QD75D□) is reduced to 0. When a "0" is set in the " [Da.6] Positioning address/movement amount" to increase the number of speed change points in the future, change the " [Da.2] Control system" to the "NOP instruction" to make the control nonexecutable.

(Refer to Section 9.2.20 "NOP instruction".)

- (4) In the continuous path control positioning data, assure a movement distance so that the execution time with that data is 100ms or longer, or lower the command speed.

## (3) Speed handling

- (a) Continuous path control command speeds are set with each positioning data.  
The QD75 then carries out the positioning at the speed designated with each positioning data.
- (b) The command speed can be set to "-1" in continuous path control.  
The control will be carried out at the speed used in the previous positioning data No. if the command speed is set to "-1".  
(The "current speed" will be displayed in the command speed when the positioning data is set with a peripheral device. The current speed is the speed of the positioning control being executed currently.)
- 1) The speed does not need to be set in each positioning data when carrying out uniform speed control if "-1" is set beforehand in the command speed.
  - 2) If the speed is changed or the override function is executed in the previous positioning data when "-1" is set in the command speed, the operation can be continued at the new speed.
  - 3) An error "No command speed" (error code: 503) occurs and positioning cannot be started if "-1" is set in the command speed of the first positioning data at start.

[Relation between the command speed and current speed]

The current speed is changed even if the command speed is not reached in P2.

## POINTS

- (1) In the continuous path control, a speed variation will not occur using the near-pass function when the positioning data is switched (Refer to Section 12.3.3 "Near-pass function").
- (2) The QD75 holds the command speed set with the positioning data, and the latest value of the speed set with the speed change request as the "Md.27 Current speed". It controls the operation at the "current speed" when "-1" is set in the command speed.  
(Depending on the relation between the movement amount and the speed, the feedrate may not reach the command speed value, but even then the current speed will be updated.)
- (3) When the address for speed change is identified beforehand, generate and execute the positioning data for speed change by the continuous path control to carry out the speed change without requesting the speed change with a sequence program.

## (4) Speed switching

(Refer to " **Pr.19** Speed switching mode".)

The two modes for changing the speed are shown below.

- Standard switching.....Switch the speed when executing the next positioning data.
- Front-loading switching.....The speed switches at the end of the positioning data currently being executed.

## (a) Standard speed switching mode

- 1) If the respective command speeds differ in the "positioning data currently being executed" and the "positioning data to carry out the next operation", the machine will accelerate or decelerate after reaching the positioning point set in the "positioning data currently being executed" and the speed will change over to the speed set in the "positioning data to carry out the next operation".
- 2) The parameters used in acceleration/deceleration to the command speed set in the "positioning data to carry out the next operation" are those of the positioning data to carry out acceleration/deceleration.  
Speed switching will not be carried out if the command speeds are the same.

Fig. 9.4 Operation for the standard speed switching mode

## 3) Speed switching condition

If the movement amount is small in regard to the target speed, the current speed may not reach the target speed even if acceleration/deceleration is carried out. In this case, the machine is accelerated/decelerated so that it nears the target speed. If the movement amount will be exceeded when automatic deceleration is required (Ex. Operation patterns "00", "01"), the machine will immediately stop at the designated positioning address, and a warning "Insufficient movement distance" (warning code: 513) will occur.

[When the speed cannot change over in P2]

When the relation of the speeds is  $P1 = P4$ ,  $P2 = P3$ ,  $P1 < P2$ .

[When the movement amount is small during automatic deceleration]

The movement amount required to carry out the automatic deceleration cannot be secured, so the machine immediately stops in a speed  $\neq 0$  status.

(b) Front-loading speed switching mode

- 1) If the respective command speeds differ in the "positioning data currently being executed" and the "positioning data to carry out the next operation", the speed will change over to the speed set in the "positioning data to carry out the next operation" at the end of the "positioning data currently being executed".
- 2) The parameters used in acceleration/deceleration to the command speed set in the "positioning data to carry out the next operation" are those of the positioning data to carry out acceleration/deceleration. Speed switching will not be carried out if the command speeds are the same.

Fig. 9.5 Operation for the front-loading speed switching mode

## 3) Speed switching condition

If the movement amount is small in regard to the target speed, the current speed may not reach the target speed even if acceleration/deceleration is carried out. In this case, the machine is accelerated/decelerated so that it nears the target speed. If the movement amount will be exceeded when automatic deceleration is required (Ex. Operation patterns "00", "01"), the machine will immediately stop at the designated positioning address, and a warning "Insufficient movement distance" (warning code: 513) will occur.

[When the speed cannot change over to the P2 speed in P1]

When the relation of the speeds is  $P1 = P4$ ,  $P2 = P3$ ,  $P1 < P2$ .

[When the movement amount is small during automatic deceleration]

The movement amount required to carry out the automatic deceleration cannot be secured, so the machine immediately stops in a speed  $\neq 0$  status.

### 9.1.3 Designating the positioning address

The following shows the two methods for commanding the position in control using positioning data.

#### ■ Absolute system

Positioning is carried out to a designated position (absolute address) having the OP as a reference. This address is regarded as the positioning address. (The start point can be anywhere.)

Fig. 9.6 Absolute system positioning

#### ■ Incremental system

The position where the machine is currently stopped is regarded as the start point, and positioning is carried out for a designated movement amount in a designated movement direction.

Fig. 9.7 Incremental system positioning

## 9.1.4 Confirming the current value

## ■ Values showing the current value

The following two types of addresses are used as values to show the position in the QD75.

These addresses ("current feed value" and "machine feed value") are stored in the monitor data area, and used in monitoring the current value display, etc.

|                    |                                                                                                                                                                                                                                                                                                                                                                                                  |
|--------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Current feed value | <ul style="list-style-type: none"> <li>• This is the value stored in " <b>[Md.20]</b> Current feed value".</li> <li>• This value has an address established with a "machine OPR" as a reference, but the address can be changed by changing the current value to a new value.</li> <li>• This value is updated every 0.9ms (QD75P□N/QD75D□N) or 1.8ms (QD75P□/QD75D□).</li> </ul>                |
| Machine feed value | <ul style="list-style-type: none"> <li>• This is the value stored in " <b>[Md.21]</b> Machine feed value".</li> <li>• This value always has an address established with a "machine OPR" as a reference. The address cannot be changed, even if the current value is changed to a new value.</li> <li>• This value is updated every 0.9ms (QD75P□N/QD75D□N) or 56.8ms (QD75P□/QD75D□).</li> </ul> |

The "current feed value" and "machine feed value" are used in monitoring the current value display, etc.

Fig. 9.8 Current feed value and machine feed value

### ■ Restrictions

A 0.9ms (QD75P□N /QD75D□N) or 1.8ms (QD75P□/QD75D□) error will occur in the current value update timing when the stored "current feed value" is used in the control.

A 0.9ms (QD75P□N /QD75D□N) or 56.8ms (QD75P□/QD75D□) error will occur in the current value update timing when the stored "machine feed value" is used in the control.

### ■ Monitoring the current value

The "current feed value" and "machine feed value" are stored in the following buffer memory addresses, and can be read using a "DFRO (P) instruction" or "DMOV (P) instruction" from the CPU module.

|                                                                   |                    | Buffer memory addresses |          |            |            |
|-------------------------------------------------------------------|--------------------|-------------------------|----------|------------|------------|
|                                                                   |                    | Axis 1                  | Axis 2   | Axis 3     | Axis 4     |
| <span style="border: 1px solid black; padding: 2px;">Md.20</span> | Current feed value | 800, 801                | 900, 901 | 1000, 1001 | 1100, 1101 |
| <span style="border: 1px solid black; padding: 2px;">Md.21</span> | Machine feed value | 802, 803                | 902, 903 | 1002, 1003 | 1102, 1103 |

- (1) The following shows the examples of programs to read out the current feed value of the axis 1 to D104 and D105 when X40 is turned ON.

(a) For the DFRO(P) instruction

(b) For the DMOV(P) instruction

## 9.1.5 Control unit "degree" handling

When the control unit is set to "degree", the following items differ from when other control units are set.

## [1] Current feed value and machine feed value addresses

The address of "Md.20" Current feed value" becomes a ring address from 0 to 359.99999°.

But the address of "Md.21" Machine feed value" doesn't become a ring address.

## [2] Software stroke limit valid/invalid setting

With the control unit set to "degree", the software stroke limit upper and lower limit values are 0 to 359.99999.

## (a) Setting to validate software stroke limit

To validate the software stroke limit, set the software stroke limit lower limit value and the upper limit value in a clockwise direction.

## 1) To set the movement range A, set as follows.

- Software stroke limit lower limit value .....315.00000°
- Software stroke limit upper limit value .....90.00000°

## 2) To set the movement range B, set as follows.

- Software stroke limit lower limit value .....90.00000°
- Software stroke limit upper limit value .....315.00000°

## (b) Setting to invalidate software stroke limit

To invalidate the software stroke limit, set the software stroke limit lower limit value equal to the software stroke limit upper limit value.

The control can be carried out irrespective of the setting of the software stroke limit.

## [3] Positioning control method when the control unit is set to "degree"

## 1) Absolute system

## (a) When the software stroke limit is invalid

Positioning is carried out in the nearest direction to the designated address, using the current value as a reference.

(This is called "shortcut control".)

## ---Example---

- 1) Positioning is carried out in a clockwise direction when the current value is moved from 315° to 45°.
- 2) Positioning is carried out in a counterclockwise direction when the current value is moved from 45° to 315°.

[To specify the positioning direction (not carrying out the shortcut control)]

Use "[Cd.40] ABS direction in degrees" or "[Da.28] ABS direction in degrees" to specify the positioning direction.

This function can be performed when the software stroke limit is invalid. When the software stroke limit is valid, an error "Illegal setting of ABS direction in unit of degree" (error code: 546) occurs and positioning is not started.

In "[Cd.40] ABS direction in degrees" or "[Da.28] ABS direction in degrees", the set value for the reference axis is applied to both the reference axis and interpolation axis. Even if a unit other than degree is set for the reference axis, the setting of the reference axis is applied to the interpolation axis as shown below (for 3-axis linear interpolation control (ABS3)).

| Axis           | Unit setting | "[Cd.40] ABS direction in degrees" | Rotation direction of the axis with degree setting |
|----------------|--------------|------------------------------------|----------------------------------------------------|
| Reference axis | pulse        | 1: ABS clockwise                   | 0                                                  |
| Sub axis 1     | degree       | -                                  | 1: ABS clockwise                                   |
| Sub axis 2     | degree       | -                                  | 1: ABS clockwise                                   |

[To specify the rotation direction in degrees for each positioning data]

To specify the rotation direction for each positioning data in a control executing multiple positioning data sets within one positioning operation continuously, such as continuous positioning control and continuous path control, use "[Da.28] ABS direction in degrees".

[To set the same rotation direction for all positioning data]

Setting "[Cd.40] ABS direction in degrees" enables batch specification of the rotation direction for each positioning data. To use "[Cd.40] ABS direction in degrees", set "0" in "[Da.28] ABS direction in degrees". When a value other than "0" is set, the setting of "[Da.28] ABS direction in degrees" becomes valid. The set value in "[Cd.40] ABS direction in degrees" becomes valid only when the positioning control is started. In the continuous positioning control or continuous path control, the operation is continued with the setting made at a start if the setting is changed during the operation.

| Name                                | Function                                                                                                                                                                                                                               | Buffer memory address     |                           |                            |                            | Initial value |

| [Da.28]<br>ABS direction in degrees | "[Cd.40] ABS direction in degrees" is set for each positioning data.<br>0: Use the set value in "[Cd.40] ABS direction in degrees".<br>1: ABS clockwise<br>2: ABS counterclockwise<br>3: Takes a shortcut. (direction setting ignored) | 2003<br>+N*<br>(b2 to b3) | 8003<br>+N*<br>(b2 to b3) | 14003<br>+N*<br>(b2 to b3) | 20003<br>+N*<br>(b2 to b3) | 0             |

※: N indicates the offset address of each positioning data.

$N = ((\text{Positioning data No.}) - 1) \times 10$

## (b) When the software stroke limit is valid

The positioning is carried out in a clockwise/counterclockwise direction depending on the software stroke limit range setting method.

Because of this, positioning with "shortcut control" may not be possible.

## Example

When the current value is moved from 0° to 315°, positioning is carried out in the clockwise direction if the software stroke limit lower limit value is 0° and the upper limit value is 345°.

**POINT**

Positioning addresses are within a range of 0° to 359.99999°.

Use the incremental system to carry out positioning of one rotation or more.

## 2) Incremental system

Positioning is carried out for a designated movement amount in a designated movement direction when in the incremental system of positioning.

The movement direction is determined by the sign (+, -) of the movement amount.

- For a positive (+) movement direction ....Clockwise
- For a negative (-) movement direction ...Counterclockwise

**POINT**

Positioning of 360° or more can be carried out with the incremental system.

At this time, set as shown below to invalidate the software stroke limit.

(Set the value with in the setting range (0° to 359.99999°).)

[Software stroke limit upper limit value = Software stroke limit lower limit value]

## 9.1.6 Interpolation control

### ■ Meaning of interpolation control

In "2-axis linear interpolation control", "3-axis linear interpolation control", "4-axis linear interpolation control", "2-axis fixed-feed control", "3-axis fixed-feed control", "4-axis fixed-feed control", "2-axis speed control", "3-axis speed control", "4-axis speed control", "2-axis circular interpolation control", and "3-axis helical interpolation control", control is carried out so that a specified path is drawn using a motor set in two to four axis directions.

This kind of control is called "interpolation control".

In interpolation control, the axis in which the control system is set is defined as the "reference axis", and the other axis is defined as the "interpolation axis".

The QD75 controls the "reference axis" following the positioning data set in the "reference axis", and controls the "interpolation axis" corresponding to the reference axis control so that a linear or arc path is drawn.

The following table shows the reference axis and interpolation axis combinations.

| Axis definition<br>Axis set to interpolation control in " Da.2 Control system"                                                | Reference axis             | Interpolation axis                              |
|-------------------------------------------------------------------------------------------------------------------------------|----------------------------|-------------------------------------------------|
| 2-axis linear interpolation control, "2-axis fixed-feed control, 2-axis circular interpolation control, 2-axis speed control" | Any of axes 1, 2, 3, and 4 | "Axes to be interpolated" set in reference axis |
| 3-axis linear interpolation control, "3-axis fixed-feed control, 3-axis speed control"                                        | Axis 1                     | Axis 2, Axis 3                                  |
|                                                                                                                               | Axis 2                     | Axis 3, Axis 4                                  |
|                                                                                                                               | Axis 3                     | Axis 4, Axis 1                                  |
|                                                                                                                               | Axis 4                     | Axis 1, Axis 2                                  |
| 4-axis linear interpolation control, "4-axis fixed-feed control, 4-axis speed control"                                        | Axis 1                     | Axis 2, Axis 3, Axis 4                          |
|                                                                                                                               | Axis 2                     | Axis 3, Axis 4, Axis 1                          |
|                                                                                                                               | Axis 3                     | Axis 4, Axis 1, Axis 2                          |
|                                                                                                                               | Axis 4                     | Axis 1, Axis 2, Axis 3                          |

The available axis combinations in the 3-axis helical interpolation control are the same as the ones in the "3-axis linear interpolation control", "3-axis fixed-feed control", and "3-axis speed control". However, the circular interpolation axis can be specified with " Da.5 Axis to be interpolated" of the reference axis.

The following table lists the combinations of the reference axis, circular interpolation axis, and linear interpolation axis for the 3-axis helical interpolation control.

| Axis definition<br>Axis set to interpolation control in " Da.2 Control system" | Reference axis | Circular interpolation axis * 1 | Linear interpolation axis * 2 |
|--------------------------------------------------------------------------------|----------------|---------------------------------|-------------------------------|
| 3-axis helical interpolation control                                           | Axis 1         | Axis 2                          | Axis 3                        |
|                                                                                |                | Axis 3                          | Axis 2                        |
|                                                                                | Axis 2         | Axis 3                          | Axis 4                        |
|                                                                                |                | Axis 4                          | Axis 3                        |
|                                                                                | Axis 3         | Axis 4                          | Axis 1                        |
|                                                                                |                | Axis 1                          | Axis 4                        |
|                                                                                | Axis 4         | Axis 1                          | Axis 2                        |
|                                                                                |                | Axis 2                          | Axis 1                        |

\* 1: Specify with " Da.5 Axis to be interpolated" of the reference axis.

\* 2: An axis which is not specified with " Da.5 Axis to be interpolated" of the reference axis is automatically assigned.

### ■ Setting the positioning data during interpolation control

When carrying out interpolation control, the same positioning data Nos. are set for the "reference axis" and the "interpolation axis".

The following table shows the "positioning data" setting items for the reference axis and interpolation axis.

| Setting item              |       | Axis                                      | Reference axis setting item                                                                                                                                                                    | Interpolation axis setting item                                                                                                 |
|---------------------------|-------|-------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------|
| Same positioning data Nos | Da.1  | Operation pattern                         | ◎                                                                                                                                                                                              | —                                                                                                                               |
|                           | Da.2  | Control system                            | Linear 2, 3, 4, Fixed-feed 2, 3, 4,<br>Circular sub, Circular right,<br>Circular left<br>Helical sub, Helical right, Helical<br>left<br>Forward run speed 2, 3, 4<br>Reverse run speed 2, 3, 4 | —                                                                                                                               |

◎ : Setting always required

○ : Set according to requirements

△ : Setting restrictions exist

— : Setting not required (Unrelated setting item, so any setting value will be ignored. Use the initial value or a value within the setting range.)

\* : For 2-axis interpolation, set the partner axis. If the self-axis is set, the error "Illegal interpolation description command" (error code: 521) will occur. For 3-axis interpolation other than 3-axis helical interpolation or 4-axis interpolation, this item does not need to be set. For 3-axis helical interpolation, refer to the previous page for the reference axis and interpolation axis combinations. If axes are set in a combination other than the ones in the previous page, the error "Illegal interpolation description command" (error code: 521) will occur.

Refer to Section 5.3 "List of positioning data" for information on the setting details.

### ■ Starting the interpolation control

The positioning data Nos. of the reference axis (axis in which interpolation control was set in " [Da.2] Control system") are started when starting the interpolation control. (Starting of the interpolation axis is not required.)

The following errors or warnings will occur and the positioning will not start if both reference axis and the interpolation axis are started.

- Reference axis : The error "Interpolation while interpolation axis BUSY" (error code: 519)
- Interpolation axis : The error "Control system setting error" (error code: 524),  
The warning "Start during operation" (warning code: 100)

### ■ Interpolation control continuous positioning

When carrying out interpolation control in which "continuous positioning control" and "continuous path control" are designated in the operation pattern, the positioning method for all positioning data from the started positioning data to the positioning data in which "positioning complete" is set must be set to interpolation control.

The number of the interpolation axes and axes to be interpolated cannot be changed from the intermediate positioning data. An error "Control system setting error" (error code: 524) will occur and the positioning will stop if setting, which changes the number of the interpolation axes and axes to be interpolated, is carried out.

### ■ Speed during interpolation control

Either the "composite speed" or "reference axis speed" can be designated as the speed during interpolation control.

([Pr.20] Interpolation speed designation method)

Only the "Reference axis speed" can be designated in the following interpolation control.

When a "composite speed" is set and positioning is started, the error "Interpolation mode error" (error code: 523) occurs, and the system will not start.

- 4-axis linear interpolation
- 2-axis speed control
- 3-axis speed control
- 4-axis speed control

### ■ Cautions in interpolation control

- (1) If a stepping motor is used, the circular interpolation control or 3-axis helical interpolation control cannot be carried out.  
Make sure to use a servomotor when the circular interpolation control or 3-axis helical interpolation control is carried out.
  - (2) If either of the axes exceeds the " **Pr.8** Speed limit value" in the 2 to 4 axes speed control, the axis which exceeded the speed limit value is controlled by the speed limit value.  
For the other axes which perform interpolation, the speed can be suppressed by the ratio of a command speed.
  - (3) If any axis exceeds " **Pr.8** Speed limit value" in any of the following control, the axis in excess of the speed limit value is controlled at the speed limit value.  
For the other axes performing interpolation, the speed can be suppressed by the ratio of a movement distance.
    - 2- to 4-axis linear interpolation control<sup>\*1</sup>
    - 2- to 4-axis fixed-feed control<sup>\*1</sup>
    - 2-axis circular interpolation control
    - 3-axis helical interpolation control<sup>\*2</sup>
- \*1: The speed limit value for the interpolation axis may not function under the following condition: "Reference axis speed" is set in in " **Pr.20** Interpolation speed designation method" or " **Da.29** Interpolation speed designation method", the reference axis is the minor axis, and the interpolation axis is the major axis.
- \*2: In 3-axis helical interpolation control, control the composite speed of the circular interpolation or the speed of the linear interpolation axis so that the speeds do not exceed " **Pr.8** Speed limit value".
- (4) In 2-axis interpolation, you cannot change the combination of interpolated axes midway through operation.

#### POINT

- When the "reference axis speed" is set during interpolation control, set so the major axis side becomes the reference axis. If the minor axis side is set as the reference axis, the major axis side speed may exceed the " **Pr.8** Speed limit value".

### ■ Interpolation speed designation method

To perform interpolation control, set the composite speed or reference axis speed in "[Pr.20] Interpolation speed designation method" or "[Da.29] Interpolation speed designation method" of the reference axis.

- 0: Composite speed ..... The movement speed for the control target is specified, and the speed for each axis is calculated by the QD75.
- 1: Reference axis speed ..... The axis speed set for the reference axis is specified, and the speed for the other axis carrying out interpolation is calculated by the QD75.

[To specify the interpolation speed for each positioning data]

To specify interpolation speed for each positioning data, use "[Da.29] Interpolation speed designation method".

[To set the same interpolation speed for all positioning data]

Setting "[Pr.20] Interpolation speed designation method" enables batch specification of the interpolation speed designation method for each positioning data.

To use "[Pr.20] Interpolation speed designation method", set "0" in "[Da.29] Interpolation speed designation method". When a value other than 0 is set, "[Da.29] Interpolation speed designation method" will be valid.

\*: N indicates the offset address of each positioning data.

$N = ((\text{Positioning data No.}) - 1) \times 10$

### ■ Limits to interpolation control

There are limits to the interpolation control that can be executed and speed ([Pr.20] Interpolation speed designation method) that can be set, depending on the "[Pr.1] Unit setting" of the reference axis and interpolation axis. (For example, circular interpolation control cannot be executed if the reference axis and interpolation axis units differ.)

The following table shows the interpolation control and speed designation limits.

| " [Da.2] Control system" interpolation control                                   | [Pr.20] Interpolation speed designation method or<br>[Da.29] Interpolation speed designation method *5 | [Pr.1] Unit setting *1                                                                            |                                                       |

○ : Setting possible, × : Setting not possible.

\*1 "mm" and "inch" unit mix possible.

\*2 The error "Circular interpolation not possible" (error code: 535) will occur and the positioning cannot be started if circular interpolation control or 3-axis helical interpolation control is set when the unit is "degree". The machine will immediately stop if "degree" is set during positioning control.

\*3 The unit set in the reference axis will be used for the speed unit during control if the units differ or if "mm" and "inch" are combined.

\*4 Only for the linear interpolation axis, a unit different from the one set for the reference axis can be used.

\*5 When positioning is started with the following setting, the error "Interpolation mode error" (error code: 523) will occur.

- A "composite speed" is set for the 2-axis speed control, 3-axis speed control, or 4-axis linear interpolation control.
- A "reference axis speed" is set for the circular interpolation control or 3-axis helical interpolation control.

### ■ Axis operation status during interpolation control

"Interpolation" will be stored in the "[Md.26] Axis operation status" during interpolation control. "Standby" will be stored when the interpolation operation is terminated. Both the reference axis and interpolation axis will carry out a deceleration stop if an error occurs during control, and "error occurring" will be stored in the operation status.

## 9.2 Setting the positioning data

## 9.2.1 Relation between each control and positioning data

The setting requirements and details for the setting items of the positioning data to be set differ according to the " **Da.2** Control system".

The following table shows the positioning data setting items corresponding to the different types of control. Details and settings for the operation of each control are shown in Section 9.2.2 and subsequent sections.

(In this section, GX Configurator-QP or GX Works2 is used for setting positioning data.)

| Major positioning control      |                                        |                                                        | Position control                                                                                                                           |                                                                                                                  |                                                    |                                                                                                                                                                                      | Speed control                                                  | Speed-position switching control |   |

◎ : Always set      ○ : Set as required

× : Setting not possible (If the setting is made, the error "Continuous path control not possible" (error code: 516) or "New current value not possible" (error code: 515) will occur at a start.)

— : Setting not required (Setting value is invalid. Use the initial values or setting values within a range where no error occurs.)

\*1: The "ABS (absolute) system" or "INC (incremental) system" can be used for the control system.

\*2: Set the M code for the reference axis and the number of pitch for the linear interpolation axis.

## REMARK

It is recommended that the "positioning data" be set whenever possible with GX Configurator-QP or GX Works2. Execution by sequence program uses many sequence programs and devices. The execution becomes complicated, and the scan times will increase.

## 9.2.2 1-axis linear control

In "1-axis linear control" (" [Da.2] Control system" = ABS linear 1, INC linear 1), one motor is used to carry out position control in a set axis direction.

## [1] 1-axis linear control (ABS linear 1)

## ■ Operation chart

In absolute system 1-axis linear control, positioning is carried out from the current stop position (start point address) to the address (end point address) set in " [Da.6] Positioning address/movement amount".

## Example

When the start point address (current stop position) is 1000, and the end point address (positioning address) is 8000, positioning is carried out in the positive direction for a movement amount of 7000 (8000-1000)

## ■ Positioning data setting example

The following table shows setting examples when "1-axis linear control (ABS linear 1)" is set in positioning data No. 1 of axis 1.

| Setting item |                                            | Setting example      | Setting details                                                                                                                  |
|--------------|--------------------------------------------|----------------------|----------------------------------------------------------------------------------------------------------------------------------|

|              | [Da.6] Positioning address/movement amount | 8000.0μm             | Set the positioning address. (Assuming "mm" is set in " [Pr.1] Unit setting".)                                                   |
|              | [Da.7] Arc address                         | —                    | Setting not required (setting value will be ignored).                                                                            |
|              | [Da.8] Command speed                       | 6000.00mm/min        | Set the speed during movement to the positioning address.                                                                        |
|              | [Da.9] Dwell time                          | 500ms                | Set the time the machine dwells after the positioning stop (pulse output stop) to the output of the positioning complete signal. |
|              | [Da.10] M code                             | 10                   | Set this when other sub operation commands are issued in combination with the No. 1 positioning data.                            |

\* Refer to Section 5.3 "List of positioning data" for information on the setting details.

## [2] 1-axis linear control (INC linear 1)

## ■ Operation chart

In incremental system 1-axis linear control, positioning of movement amount set in "Da.6 Positioning address/movement amount" is carried out from the current stop position (start point address). The movement direction is determined by the sign of the movement amount.

## ---Example---

When the start point address is 5000, and the movement amount is -7000, positioning is carried out to the -2000 position.

## ■ Positioning data setting example

The following table shows setting examples when "1-axis linear control (INC linear 1)" is set in positioning data No. 1 of axis 1.

| Setting item                  |                                          | Setting example      | Setting details                                                                                                                  |
|-------------------------------|------------------------------------------|----------------------|----------------------------------------------------------------------------------------------------------------------------------|
| Axis 1 Positioning data No. 1 | Da.1 Operation pattern                   | Positioning complete | Set "Positioning complete" assuming the next positioning data will not be executed.                                              |
|                               | Da.2 Control system                      | INC linear 1         | Set incremental system 1-axis linear control.                                                                                    |
|                               | Da.3 Acceleration time No.               | 1                    | Designate the value set in "Pr.25 Acceleration time 1" as the acceleration time at start.                                        |
|                               | Da.4 Deceleration time No.               | 0                    | Designate the value set in "Pr.10 Deceleration time 0" as the deceleration time at deceleration.                                 |
|                               | Da.5 Axis to be interpolated             | —                    | Setting not required (setting value will be ignored).                                                                            |
|                               | Da.6 Positioning address/movement amount | -7000.0 μm           | Set the movement amount. (Assuming "mm" is set in "Pr.1 Unit setting".)                                                          |
|                               | Da.7 Arc address                         | —                    | Setting not required (setting value will be ignored).                                                                            |
|                               | Da.8 Command speed                       | 6000.00mm/min        | Set the speed during movement.                                                                                                   |
|                               | Da.9 Dwell time                          | 500ms                | Set the time the machine dwells after the positioning stop (pulse output stop) to the output of the positioning complete signal. |
|                               | Da.10 M code                             | 10                   | Set this when other sub operation commands are issued in combination with the No. 1 positioning data.                            |

\* Refer to Section 5.3 "List of positioning data" for information on the setting details.

## 9.2.3 2-axis linear interpolation control

In "2-axis linear interpolation control" (" **Da.2** Control system" = ABS linear 2, INC linear 2), two motors are used to carry out position control in a linear path while carrying out interpolation for the axis directions set in each axis.  
(Refer to Section 9.1.6 "Interpolation control" for details on interpolation control.)

## [1] 2-axis linear interpolation control (ABS linear 2)

## ■ Operation chart

In absolute system 2-axis linear interpolation control, specified two axes are used to perform linear interpolation positioning from the current stop position (start point address) to the address set in the " **Da.6** Positioning address/movement amount" (end point address).

## --Example--

When the start point address (current stop position) is (1000, 1000) and the end point address (positioning address) is (10000, 4000), positioning is carried out as follows.

### ■ Restrictions

An error will occur and the positioning will not start in the following cases. The machine will immediately stop if the error is detected during a positioning control.

- If the movement amount of each axis exceeds "1073741824 ( $=2^{30}$ )" when "0: Composite speed" is set in " **Pr.20** Interpolation speed designation method" ... The error "Outside linear movement amount range" (error code: 504) occurs at a positioning start.  
(The maximum movement amount that can be set in " **Da.6** Positioning address/movement amount" is "1073741824 ( $=2^{30}$ )".)

### ■ Positioning data setting example

[Reference axis and interpolation axis are designated as axis 1 and axis 2, respectively.]

The following table shows setting examples when "2-axis linear interpolation control (ABS linear 2)" is set in positioning data No. 1 of axis 1. (The required values are also set in positioning data No. 1 of axis 2.)

| Setting item |                        | Axis                                | Axis 1<br>(reference<br>axis) setting<br>example | Axis 2<br>(interpolation<br>axis) setting<br>example | Setting details                                                                                                                  |
|--------------|------------------------|-------------------------------------|--------------------------------------------------|------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------|

|              | <b>Da.1</b>            | Operation pattern                   | Positioning complete                             | —                                                    | Set "Positioning complete" assuming the next positioning data will not be executed.                                              |
|              | <b>Da.2</b>            | Control system                      | ABS linear 2                                     | —                                                    | Set absolute system 2-axis linear interpolation control.                                                                         |
|              | <b>Da.3</b>            | Acceleration time No.               | 1                                                | —                                                    | Designate the value set in " <b>Pr.25</b> Acceleration time 1" as the acceleration time at start.                                |
|              | <b>Da.4</b>            | Deceleration time No.               | 0                                                | —                                                    | Designate the value set in " <b>Pr.10</b> Deceleration time 0" as the deceleration time at deceleration.                         |
|              | <b>Da.5</b>            | Axis to be interpolated             | Axis 2                                           | —                                                    | Set the axis to be interpolated (partner axis).<br>If the self-axis is set, an error will occur.                                 |
|              | <b>Da.6</b>            | Positioning address/movement amount | 10000.0μm                                        | 4000.0μm                                             | Set the end point address. (Assuming "mm" is set in " <b>Pr.1</b> Unit setting".)                                                |
|              | <b>Da.7</b>            | Arc address                         | —                                                | —                                                    | Setting not required (setting value will be ignored).                                                                            |
|              | <b>Da.8</b>            | Command speed                       | 6000.00 mm/min                                   | —                                                    | Set the speed during movement to the end point address.                                                                          |
|              | <b>Da.9</b>            | Dwell time                          | 500ms                                            | —                                                    | Set the time the machine dwells after the positioning stop (pulse output stop) to the output of the positioning complete signal. |
|              | <b>Da.10</b>           | M code                              | 10                                               | —                                                    | Set this when other sub operation commands are issued in combination with the No. 1 positioning data.                            |

\* Refer to Section 5.3 "List of positioning data" for information on the setting details.

### POINT

- When the "reference axis speed" is set during 2-axis linear interpolation control, set so the major axis side becomes the reference axis. If the minor axis side is set as the reference axis, the major axis side speed may exceed the " **Pr.8** Speed limit value".

## [2] 2-axis linear interpolation control (INC linear 2)

## ■ Operation chart

In incremental system 2-axis linear interpolation control, designated 2 axes are used. Linear interpolation positioning of movement amount set in "Da.6 Positioning address/movement amount" is carried out from the current stop position (start point address). The movement direction is determined by the sign of the movement amount.

## Example

When the axis 1 movement amount is 9000 and the axis 2 movement amount is -3000, positioning is carried out as follows.

### ■ Restrictions

An error will occur and the positioning will not start in the following cases. The machine will immediately stop if the error is detected during a positioning operation.

- If the movement amount of each axis exceeds "1073741824 ( $=2^{30}$ )" when "0: Composite speed" is set in " [Pr.20] Interpolation speed designation method" ... The error "Outside linear movement amount range" (error code: 504) occurs at a positioning start.  
(The maximum movement amount that can be set in " [Da.6] Positioning address/movement amount" is "1073741824 ( $=2^{30}$ )".)

### ■ Positioning data setting example

[Reference axis and interpolation axis are designated as axis 1 and axis 2, respectively.]

The following table shows setting examples when "2-axis linear interpolation control (INC linear 2)" is set in positioning data No. 1 of axis 1. (The required values are also set in positioning data No. 1 of axis 2.)

| Setting item |                        | Axis                                | Axis 1<br>(reference<br>axis) setting<br>example | Axis 2<br>(interpolation<br>axis) setting<br>example | Setting details                                                                                                                  |
|--------------|------------------------|-------------------------------------|--------------------------------------------------|------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------|

|              | [Da.6]                 | Positioning address/movement amount | 9000.0μm                                         | -3000.0μm                                            | Set the movement amount. (Assuming "mm" is set in " [Pr.1] Unit setting".)                                                       |
|              | [Da.7]                 | Arc address                         | —                                                | —                                                    | Setting not required (setting value will be ignored).                                                                            |
|              | [Da.8]                 | Command speed                       | 6000.00 mm/min                                   | —                                                    | Set the speed during movement.                                                                                                   |
|              | [Da.9]                 | Dwell time                          | 500ms                                            | —                                                    | Set the time the machine dwells after the positioning stop (pulse output stop) to the output of the positioning complete signal. |
|              | [Da.10]                | M code                              | 10                                               | —                                                    | Set this when other sub operation commands are issued in combination with the No. 1 positioning data.                            |

\* Refer to Section 5.3 "List of positioning data" for information on the setting details.

### POINT

- When the "reference axis speed" is set during 2-axis linear interpolation control, set so the major axis side becomes the reference axis. If the minor axis side is set as the reference axis, the major axis side speed may exceed the " [Pr.8] Speed limit value".

## 9.2.4 3-axis linear interpolation control

In "3-axis linear interpolation control" (" **Da.2** Control system" = ABS linear 3, INC linear 3), three motors are used to carry out position control in a linear path while carrying out interpolation for the axis directions set in each axis.  
(Refer to Section 9.1.6 "Interpolation control" for details on interpolation control.)

## [1] 3-axis linear interpolation control (ABS linear 3)

## ■ Operation chart

In absolute system 3-axis linear interpolation control, 3 axes are used. Linear interpolation positioning is carried out from the current stop position (start point address) to the address (end point address) set in " **Da.6** Positioning address/movement amount".

## Example

When the start point address (current stop position) is (1000, 2000, 1000) and the end point address (positioning address) is (4000, 8000, 4000), positioning is carried out as follows.

### ■ Restrictions

An error will occur and the positioning will not start in the following cases. The machine will immediately stop if the error is detected during a positioning control.

- If the movement amount of each axis exceeds "1073741824 ( $=2^{30}$ )" when "0: Composite speed" is set in " **Pr.20** Interpolation speed designation method" ... The error "Outside linear movement amount range" (error code: 504) occurs at a positioning start.  
(The maximum movement amount that can be set in " **Da.6** Positioning address/movement amount" is "1073741824 ( $=2^{30}$ )".)

### ■ Positioning data setting example

[Reference axis is designated as axis 1.]

The following table shows setting examples when "3-axis linear interpolation control (ABS linear 3)" is set in positioning data No. 1 of axis 1. (The required values are also set in positioning data No. 1 of axis 2 and axis 3.)

| Setting item \ Axis           |                                                 | Axis 1<br>(reference axis) setting example | Axis 2<br>(interpolation axis) setting example | Axis 3<br>(interpolation axis) setting example | Setting details                                                                                                                            |
|-------------------------------|-------------------------------------------------|--------------------------------------------|------------------------------------------------|------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------|
| Axis 1 Positioning data No. 1 | <b>Da.1</b> Operation pattern                   | Positioning complete                       | —                                              | —                                              | Set "Positioning complete" assuming the next positioning data will not be executed.                                                        |
|                               | <b>Da.2</b> Control system                      | ABS linear 3                               | —                                              | —                                              | Set absolute system 3-axis linear interpolation control.                                                                                   |

|                               | <b>Da.5</b> Axis to be interpolated             | —                                          | —                                              | —                                              | Setting not required (setting value will be ignored).<br>When axis 1 is used as a reference axis, the interpolation axes are axes 2 and 3. |
|                               | <b>Da.6</b> Positioning address/movement amount | 4000.0μm                                   | 8000.0μm                                       | 4000.0μm                                       | Set the end point address. (Assuming "mm" is set in " <b>Pr.1</b> Unit setting".)                                                          |
|                               | <b>Da.7</b> Arc address                         | —                                          | —                                              | —                                              | Setting not required (setting value will be ignored).                                                                                      |
|                               | <b>Da.8</b> Command speed                       | 6000.00 mm/min                             | —                                              | —                                              | Set the speed during movement to the end point address.                                                                                    |
|                               | <b>Da.9</b> Dwell time                          | 500ms                                      | —                                              | —                                              | Set the time the machine dwells after the positioning stop (pulse output stop) to the output of the positioning complete signal.           |
|                               | <b>Da.10</b> M code                             | 10                                         | —                                              | —                                              | Set this when other sub operation commands are issued in combination with the No. 1 positioning data.                                      |

\* Refer to Section 5.3 "List of positioning data" for information on the setting details.

**POINTS**

- When the "reference axis speed" is set during 3-axis linear interpolation control, set so the major axis side becomes the reference axis. If the minor axis side is set as the reference axis, the major axis side speed may exceed the " **Pr.8** Speed limit value".
- Refer to Section 9.1.6 "Interpolation control" for the reference axis and interpolation axis combinations.

## [2] 3-axis linear interpolation control (INC linear 3)

## ■ Operation chart

In incremental system 3-axis linear interpolation control, designated 3 axes are used. Linear interpolation positioning of movement amount set in "Da.6 Positioning address/movement amount" is carried out from the current stop position (start point address). The movement direction is determined by the sign of the movement amount.

## -Example-

When the axis 1 movement amount is 10000, the axis 2 movement amount is 5000 and the axis 3 movement amount is 6000, positioning is carried out as follows.

### ■ Restrictions

An error will occur and the positioning will not start in the following cases. The machine will immediately stop if the error is detected during a positioning operation.

- If the movement amount of each axis exceeds "1073741824 ( $=2^{30}$ )" when "0: Composite speed" is set in " [Pr.20] Interpolation speed designation method" ... The error "Outside linear movement amount range" (error code: 504) occurs at a positioning start.  
(The maximum movement amount that can be set in " [Da.6] Positioning address/movement amount" is "1073741824 ( $=2^{30}$ )".)

### ■ Positioning data setting example

[Reference axis is designated as axis 1.]

The following table shows setting examples when "3-axis linear interpolation control (INC linear 3)" is set in positioning data No. 1 of axis 1. (The required values are also set in positioning data No. 1 of axis 2 and axis 3.)

| Setting item                  |         | Axis                                | Axis 1<br>(reference<br>axis) setting<br>example | Axis 2<br>(interpolation<br>axis) setting<br>example | Axis 3<br>(interpolation<br>axis) setting<br>example | Setting details                                                                                                                            |
|-------------------------------|---------|-------------------------------------|--------------------------------------------------|------------------------------------------------------|------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------|

|                               | [Da.10] | M code                              | 10                                               | —                                                    | —                                                    | Set this when other sub operation commands are issued in combination with the No. 1 positioning data.                                      |

\* Refer to Section 5.3 "List of positioning data" for information on the setting details.

**POINTS**

- (1) When the "reference axis speed" is set during 3-axis linear interpolation control, set so the major axis side becomes the reference axis. If the minor axis side is set as the reference axis, the major axis side speed may exceed the " **Pr.8** Speed limit value".
- (2) Refer to Section 9.1.6 "Interpolation control" for the reference axis and interpolation axis combinations.

### 9.2.5 4-axis linear interpolation control

In "4-axis linear interpolation control" (" [Da.2](#) Control system" = ABS linear 4, INC linear 4), four motors are used to carry out position control in a linear path while carrying out interpolation for the axis directions set in each axis.  
(Refer to Section 9.1.6 "Interpolation control" for details on interpolation control.)

#### [1] 4-axis linear interpolation control (ABS linear 4)

In absolute system 4-axis linear interpolation control, 4 axes are used. Linear interpolation positioning is carried out from the current stop position (start point address) to the address (end point address) set in " [Da.6](#) Positioning address/movement amount".

### ■ Positioning data setting example

[Reference axis is designated as axis 1.]

The following table shows setting examples when "4-axis linear interpolation control (ABS linear 4)" is set in positioning data No. 1 of axis 1. (The required values are also set in positioning data No. 1 of axis 2, axis 3 and axis 4.)

| Setting item                  |       | Axis                                | Axis 1<br>(reference<br>axis) setting<br>example | Axis 2<br>(interpolation<br>axis) setting<br>example | Axis 3<br>(interpolation<br>axis) setting<br>example | Axis 4<br>(interpolation<br>axis) setting<br>example | Setting details                                                                                                                               |

\* Refer to Section 5.3 "List of positioning data" for information on the setting details.

### POINTS

- (1) When the "reference axis speed" is set during 4-axis linear interpolation control, set so the major axis side becomes the reference axis. If the minor axis side is set as the reference axis, the major axis side speed may exceed the " Pr.8 Speed limit value".
- (2) Refer to Section 9.1.6 "Interpolation control" for the reference axis and interpolation axis combinations.

**[2] 4-axis linear interpolation control (INC linear 4)****■ Operation chart**

In incremental system 4-axis linear interpolation control, designated 4 axes are used. Linear interpolation positioning of movement amount set in " Da.6 Positioning address/movement amount" is carried out from the current stop position (start point address). The movement direction is determined by the sign of the movement amount.

### ■ Positioning data setting example

[Reference axis is designated as axis 1.]

The following table shows setting examples when "4-axis linear interpolation control (INC linear 4)" is set in positioning data No. 1 of axis 1. (The required values are also set in positioning data No. 1 of axis 2, axis 3 and axis 4.)

| Setting item |                        | Axis                                | Axis 1<br>(reference<br>axis) setting<br>example | Axis 2<br>(interpolation<br>axis) setting<br>example | Axis 3<br>(interpolation<br>axis) setting<br>example | Axis 4<br>(interpolation<br>axis) setting<br>example | Setting details                                                                                                                               |

|              | Da.9                   | Dwell time                          | 500ms                                            | —                                                    | —                                                    | —                                                    | Set the time the machine dwells after the positioning stop (pulse output stop) to the output of the positioning complete signal.              |
|              | Da.10                  | M code                              | 10                                               | —                                                    | —                                                    | —                                                    | Set this when other sub operation commands are issued in combination with the No. 1 positioning data.                                         |

\* Refer to Section 5.3 "List of positioning data" for information on the setting details.

### POINTS

- (1) When the "reference axis speed" is set during 4-axis linear interpolation control, set so the major axis side becomes the reference axis. If the minor axis side is set as the reference axis, the major axis side speed may exceed the " Pr.8 Speed limit value".
- (2) Refer to Section 9.1.6 "Interpolation control" for the reference axis and interpolation axis combinations.

## 9.2.6 1-axis fixed-feed control

In "1-axis fixed-feed control" (" [Da.2] Control system" = fixed-feed 1), one motor is used to carry out fixed-feed control in a set axis direction.

In fixed-feed control, any remainder of the movement amount designated in the positioning data is rounded down if less than that required for control accuracy to output the same amount of pulses.

### ■ Operation chart

In 1-axis fixed-feed control, the address ([Md.20] Current feed value) of the current stop position (start point address) is set to "0". Positioning is then carried out to a position at the end of the movement amount set in " [Da.6] Positioning address/movement amount".

The movement direction is determined by the movement amount sign.

### ■ Restrictions

- (1) An axis error "Continuous path control not possible" (error code: 516) will occur and the operation cannot start if "continuous path control" is set in " [Da.1] Operation pattern". ("Continuous path control" cannot be set in fixed-feed control.)
- (2) "Fixed-feed" cannot be set in " [Da.2] Control system" in the positioning data when "continuous path control" has been set in " [Da.1] Operation pattern" of the immediately prior positioning data. (For example, if the operation pattern of positioning data No. 1 is "continuous path control", fixed-feed control cannot be set in positioning data No. 2.) An axis error "Continuous path control not possible" (error code: 516) will occur and the machine will carry out a deceleration stop if this type of setting is carried out.

**POINT**

- When the movement amount is converted to the actual number of output pulses, a fraction appears after the decimal point, according to the movement amount per pulse. This fraction is normally retained in the QD75 and reflected at the next positioning.

For the fixed-feed control, since the movement distance is maintained constant (= the output number of pulses is maintained constant), the control is carried out after the fractional pulse is cleared to zero at start.

【Accumulation/cutoff for fractional pulses】

When movement amount per pulse is  $1.0\mu\text{m}$  and movement for  $2.5\mu\text{m}$  is executed two times;

⇒ Conversion to output pulses:  $2.5[\mu\text{m}] \div 1.0 = 2.5$  pulses

### ■ Positioning data setting example

The following table shows setting examples when "1-axis fixed-feed control (fixed-feed 1)" is set in positioning data No. 1 of axis 1.

| Setting item                  |                                          | Setting example      | Setting details                                                                                                                  |
|-------------------------------|------------------------------------------|----------------------|----------------------------------------------------------------------------------------------------------------------------------|
| Axis 1 Positioning data No. 1 | Da.1 Operation pattern                   | Positioning complete | Set "Positioning complete" assuming the next positioning data will not be executed.                                              |
|                               | Da.2 Control system                      | Fixed-feed 1         | Set 1-axis fixed-feed control.                                                                                                   |
|                               | Da.3 Acceleration time No.               | 1                    | Designate the value set in " Pr.25 Acceleration time 1" as the acceleration time at start.                                       |
|                               | Da.4 Deceleration time No.               | 0                    | Designate the value set in " Pr.10 Deceleration time 0" as the deceleration time at deceleration.                                |
|                               | Da.5 Axis to be interpolated             | —                    | Setting not required (setting value will be ignored).                                                                            |
|                               | Da.6 Positioning address/movement amount | 8000.0μm             | Set the positioning address. (Assuming "mm" is set in " Pr.1 Unit setting".)                                                     |
|                               | Da.7 Arc address                         | —                    | Setting not required (setting value will be ignored).                                                                            |
|                               | Da.8 Command speed                       | 6000.00mm/min        | Set the speed during movement to the positioning address.                                                                        |
|                               | Da.9 Dwell time                          | 500ms                | Set the time the machine dwells after the positioning stop (pulse output stop) to the output of the positioning complete signal. |
|                               | Da.10 M code                             | 10                   | Set this when other sub operation commands are issued in combination with the No. 1 positioning data.                            |

\* Refer to Section 5.3 "List of positioning data" for information on the setting details.

## 9.2.7 2-axis fixed-feed control (interpolation)

In "2-axis fixed-feed control" (" [Da.2] Control system" = fixed-feed 2), two motors are used to carry out fixed-feed control in a linear path while carrying out interpolation for the axis directions set in each axis.

In fixed-feed control, any remainder of the movement amount designated in the positioning data is rounded down if less than that required for control accuracy to output the same amount of pulses.

(Refer to Section 9.1.6 "Interpolation control" for details on interpolation control.)

### ■ Operation chart

In incremental system 2-axis fixed-feed control, the addresses ([Md.20] Current feed value) of the current stop position (start addresses) of both axes are set to "0". Linear interpolation positioning is then carried out from that position to a position at the end of the movement amount set in " [Da.6] Positioning address/movement amount". The movement direction is determined by the sign of the movement amount.

### ■ Restrictions

- (1) An axis error "Continuous path control not possible" (error code: 516) will occur and the operation cannot start if "continuous path control" is set in " [Da.1] Operation pattern". ("Continuous path control" cannot be set in fixed-feed control.)
- (2) If the movement amount of each axis exceeds "1073741824 ( $=2^{30}$ )" when "0: Composite speed" is set in " [Pr.20] Interpolation speed designation method", the error "Outside linear movement amount range" (error code: 504) occurs at a positioning start and positioning cannot be started. (The maximum movement amount that can be set in " [Da.6] Positioning address/movement amount" is "1073741824 ( $=2^{30}$ )".)
- (3) "Fixed-feed" cannot be set in " [Da.2] Control system" in the positioning data when "continuous path control" has been set in " [Da.1] Operation pattern" of the immediately prior positioning data. (For example, if the operation pattern of positioning data No. 1 is "continuous path control", fixed-feed control cannot be set in positioning data No. 2.) An axis error "Continuous path control not possible" (error code: 516) will occur and the machine will carry out a deceleration stop if this type of setting is carried out.

### ■ Positioning data setting example

[Reference axis and interpolation axis are designated as axis 1 and axis 2, respectively.]

The following table shows setting examples when "2-axis fixed-dimension feed control (fixed-feed 2)" is set in positioning data No. 1 of axis 1. (The required values are also set in positioning data No. 1 of axis 2.)

| Setting item |                        | Axis                                 | Axis 1<br>(reference<br>axis) setting<br>example | Axis 2<br>(interpolation<br>axis) setting<br>example | Setting details                                                                                                                              |
|--------------|------------------------|--------------------------------------|--------------------------------------------------|------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------|
| Axis 1       | Positioning data No. 1 |                                      |                                                  |                                                      |                                                                                                                                              |
|              | [Da.1]                 | Operation pattern                    | Positioning complete                             | —                                                    | Set "Positioning complete" assuming the next positioning data will not be executed.                                                          |
|              | [Da.2]                 | Control system                       | Fixed-feed 2                                     | —                                                    | Set 2-axis fixed-feed control.                                                                                                               |
|              | [Da.3]                 | Acceleration time No.                | 1                                                | —                                                    | Designate the value set in " [Pr.25] Acceleration time 1" as the acceleration time at start.                                                 |
|              | [Da.4]                 | Deceleration time No.                | 0                                                | —                                                    | Designate the value set in " [Pr.10] Deceleration time 0" as the deceleration time at deceleration.                                          |
|              | [Da.5]                 | Axis to be interpolated              | Axis 2                                           | —                                                    | Set the axis to be interpolated (partner axis).<br>If the self-axis is set, an error will occur.                                             |
|              | [Da.6]                 | Positioning address/ movement amount | 8000.0μm                                         | 6000.0μm                                             | Set the positioning address. (Assuming "mm" is set in " [Pr.1] Unit setting".)                                                               |
|              | [Da.7]                 | Arc address                          | —                                                | —                                                    | Setting not required (setting value will be ignored).                                                                                        |
|              | [Da.8]                 | Command speed                        | 6000.00 mm/min                                   | —                                                    | Set the speed during movement. (Designate the composite speed of reference axis speed in " [Pr.20] Interpolation speed designation method".) |
|              | [Da.9]                 | Dwell time                           | 500ms                                            | —                                                    | Set the time the machine dwells after the positioning stop (pulse output stop) to the output of the positioning complete signal.             |
|              | [Da.10]                | M code                               | 10                                               | —                                                    | Set this when other sub operation commands are issued in combination with the No. 1 positioning data.                                        |

\* Refer to Section 5.3 "List of positioning data" for information on the setting details.

**POINTS**

- (1) When the movement amount is converted to the actual number of output pulses, a fraction appears after the decimal point, according to the movement amount per pulse. This fraction is normally retained in the QD75 and reflected at the next positioning.
- For the fixed-feed control, since the movement distance is maintained constant (= the output number of pulses is maintained constant), the control is carried out after the fractional pulse is cleared to zero at start.

**【Accumulation/cutoff for fractional pulses】**

When movement amount per pulse is  $1.0\mu\text{m}$  and movement for  $2.5\mu\text{m}$  is executed two times;

⇒ Conversion to output pulses:  $2.5[\mu\text{m}] \div 1.0 = 2.5$  pulses

- (2) When the "reference axis speed" is set during 2-axis fixed-feed control, set so the major axis side becomes the reference axis. If the minor axis side is set as the reference axis, the major axis side speed may exceed the " **Pr.8** Speed limit value".

### 9.2.8 3-axis fixed-feed control (interpolation)

In "3-axis fixed-feed control" (" Da.2 Control system" = fixed-feed 3), three motors are used to carry out fixed-feed control in a linear path while carrying out interpolation for the axis directions set in each axis.

In fixed-feed control, any remainder of the movement amount designated in the positioning data is rounded down if less than that required for control accuracy to output the same amount of pulses.

(Refer to Section 9.1.6 "Interpolation control" for details on interpolation control.)

### ■ Operation chart

In incremental system 3-axis fixed-feed control, the addresses (**[Md.20]** Current feed value) of the current stop position (start addresses) of every axes are set to "0". Linear interpolation positioning is then carried out from that position to a position at the end of the movement amount set in "**[Da.6]** Positioning address/movement amount". The movement direction is determined by the sign of the movement amount.

**■ Restrictions**

- (1) An axis error "Continuous path control not possible" (error code: 516) will occur and the operation cannot start if "continuous path control" is set in "Da.1 Operation pattern". ("Continuous path control" cannot be set in fixed-feed control.)
- (2) If the movement amount of each axis exceeds "1073741824 ( $=2^{30}$ )" when "0: Composite speed" is set in "Pr.20 Interpolation speed designation method", the error "Outside linear movement amount range" (error code: 504) occurs at a positioning start and positioning cannot be started. (The maximum movement amount that can be set in "Da.6 Positioning address/movement amount" is "1073741824 ( $=2^{30}$ )".)
- (3) "Fixed-feed" cannot be set in "Da.2 Control system" in the positioning data when "continuous path control" has been set in "Da.1 Operation pattern" of the immediately prior positioning data. (For example, if the operation pattern of positioning data No. 1 is "continuous path control", fixed-feed control cannot be set in positioning data No. 2.) An axis error "Continuous path control not possible" (error code: 516) will occur and the machine will carry out a deceleration stop if this type of setting is carried out.

**■ Positioning data setting example**

[Reference axis is designated as axis 1.]

The following table shows setting examples when "3-axis fixed-feed control (fixed-feed 3)" is set in positioning data No. 1 of axis 1. (The required values are also set in positioning data No. 1 of axis 2 and axis 3.)

| Setting item                     |       | Axis                                |                      | Axis 1<br>(reference<br>axis) setting<br>example | Axis 2<br>(interpolation<br>axis) setting<br>example | Axis 3<br>(interpolation<br>axis) setting<br>example | Setting details                                                                                                                            |

|                                  | Da.9  | Dwell time                          | 500ms                | —                                                | —                                                    | —                                                    | Set the time the machine dwells after the positioning stop (pulse output stop) to the output of the positioning complete signal.           |
|                                  | Da.10 | M code                              | 10                   | —                                                | —                                                    | —                                                    | Set this when other sub operation commands are issued in combination with the No. 1 positioning data.                                      |

\* Refer to Section 5.3 "List of positioning data" for information on the setting details.

**POINTS**

- (1) When the movement amount is converted to the actual number of output pulses, a fraction appears after the decimal point, according to the movement amount per pulse. This fraction is normally retained in the QD75 and reflected at the next positioning.  
For the fixed-feed control, since the movement distance is maintained constant (= the output number of pulses is maintained constant), the control is carried out after the fractional pulse is cleared to zero at start.

**【Accumulation/cutoff for fractional pulses】**

When movement amount per pulse is  $1.0\mu\text{m}$  and movement for  $2.5\mu\text{m}$  is executed two times;

⇒ Conversion to output pulses:  $2.5[\mu\text{m}] \div 1.0 = 2.5$  pulses

- (2) When the "reference axis speed" is set during 3-axis fixed-feed control, set so the major axis side becomes the reference axis. If the minor axis side is set as the reference axis, the major axis side speed may exceed the " **Pr.8** Speed limit value".
- (3) Refer to Section 9.1.6 "Interpolation control" for the reference axis and interpolation axis combinations.

### 9.2.9 4-axis fixed-feed control (interpolation)

In "4-axis fixed-feed control" (" [Da.2](#) Control system" = fixed-feed 4), four motors are used to carry out fixed-feed control in a linear path while carrying out interpolation for the axis directions set in each axis.

In fixed-feed control, any remainder of the movement amount designated in the positioning data is rounded down if less than that required for control accuracy to output the same amount of pulses.

(Refer to Section 9.1.6 "Interpolation control" for details on interpolation control.)

#### ■ Operation chart

In incremental system 4-axis fixed-feed control, the addresses ([Md.20](#) Current feed value) of the current stop position (start addresses) of every axes are set to "0". Linear interpolation positioning is then carried out from that position to a position at the end of the movement amount set in " [Da.6](#) Positioning address/movement amount". The movement direction is determined by the sign of the movement amount.

#### ■ Restrictions

- (1) An axis error "Continuous path control not possible" (error code: 516) will occur and the operation cannot start if "continuous path control" is set in " [Da.1](#) Operation pattern". ("Continuous path control" cannot be set in fixed-feed control.)
- (2) For 4-axis fixed-feed control, set "1: Reference axis speed" in " [Pr.20](#) Interpolation speed designation method". An error "Interpolation mode error" (error code: 523) will occur and the operation cannot start if "0: Composite speed" is set.
- (3) "Fixed-feed" cannot be set in " [Da.2](#) Control system" in the positioning data when "continuous path control" has been set in " [Da.1](#) Operation pattern" of the immediately prior positioning data. (For example, if the operation pattern of positioning data No. 1 is "continuous path control", fixed-feed control cannot be set in positioning data No. 2.) An axis error "Continuous path control not possible" (error code: 516) will occur and the machine will carry out a deceleration stop if this type of setting is carried out.

### ■ Positioning data setting example

[Reference axis is designated as axis 1.]

The following table shows setting examples when "4-axis fixed-feed control (fixed-feed 4)" is set in positioning data No. 1 of axis 1. (The required values are also set in positioning data No. 1 of axis 2, axis 3 and axis 4.)

| Setting item                  |       | Axis                                | Axis 1<br>(reference<br>axis) setting<br>example | Axis 2<br>(interpolation<br>axis) setting<br>example | Axis 3<br>(interpolation<br>axis) setting<br>example | Axis 4<br>(interpolation<br>axis) setting<br>example | Setting details                                                                                                                               |

(Assuming "mm" is set in " Pr.1 Unit setting".)                                                                  |
|                               | Da.7  | Arc address                         | —                                                | —                                                    | —                                                    | —                                                    | Setting not required (setting value will be ignored).                                                                                         |
|                               | Da.8  | Command speed                       | 6000.00 mm/min                                   | —                                                    | —                                                    | —                                                    | Set the speed during movement.                                                                                                                |
|                               | Da.9  | Dwell time                          | 500ms                                            | —                                                    | —                                                    | —                                                    | Set the time the machine dwells after the positioning stop (pulse output stop) to the output of the positioning complete signal.              |
|                               | Da.10 | M code                              | 10                                               | —                                                    | —                                                    | —                                                    | Set this when other sub operation commands are issued in combination with the No. 1 positioning data.                                         |

\* Refer to Section 5.3 "List of positioning data" for information on the setting details.

**POINTS**

- (1) When the movement amount is converted to the actual number of output pulses, a fraction appears after the decimal point, according to the movement amount per pulse. This fraction is normally retained in the QD75 and reflected at the next positioning. For the fixed-feed control, since the movement distance is maintained constant (= the output number of pulses is maintained constant), the control is carried out after the fractional pulse is cleared to zero at start.

**【Accumulation/cutoff for fractional pulses】**

When movement amount per pulse is  $1.0\mu\text{m}$  and movement for  $2.5\mu\text{m}$  is executed two times;

⇒ Conversion to output pulses:  $2.5[\mu\text{m}] \div 1.0 = 2.5$  pulses

- (2) For 4-axis fixed-feed control, set the "reference axis speed" and make setting so that the major axis side becomes the reference axis. If the minor axis side is set as the reference axis, the major axis side speed may exceed the " **Pr.8** Speed limit value".
- (3) Refer to Section 9.1.6 "Interpolation control" for the reference axis and interpolation axis combinations.

## 9.2.10 2-axis circular interpolation control with sub point designation

In "2-axis circular interpolation control" (" **Da.2** Control system" = ABS circular sub, INC circular sub), two motors are used to carry out position control in an arc path passing through designated sub points, while carrying out interpolation for the axis directions set in each axis.

(Refer to Section 9.1.6 "Interpolation control" for details on interpolation control.)

[1] 2-axis circular interpolation control with sub point designation  
(ABS circular sub)

■ Operation chart

In the absolute system, 2-axis circular interpolation control with sub point designation, positioning is carried out from the current stop position (start point address) to the address (end point address) set in " **Da.6** Positioning address/movement amount", in an arc path that passes through the sub point address set in " **Da.7** Arc address".

The resulting control path is an arc having as its center the intersection point of perpendicular bisectors of a straight line between the start point address (current stop position) and sub point address (arc address), and a straight line between the sub point address (arc address) and end point address (positioning address).

**■ Restrictions**

- (1) 2-axis circular interpolation control cannot be set in the following cases.
  - When "degree" is set in " **Pr.1** Unit setting"
  - When the units set in " **Pr.1** Unit setting" are different for the reference axis and interpolation axis. ("mm" and "inch" combinations are possible.)
  - When "reference axis speed" is set in " **Pr.20** Interpolation speed designation method"
- (2) An error will occur and the positioning start will not be possible in the following cases. The machine will immediately stop if the error is detected during positioning control.
  - When the radius exceeds "536870912 ( $=2^{29}$ )". (The maximum radius for which circular interpolation control is possible is "536870912 ( $=2^{29}$ )"
    - ... An error "Outside radius range" (error code: 544) will occur at positioning start.
  - When the center point address is outside the range of "-2147483648 ( $-2^{31}$ ) to 2147483647 ( $2^{31}-1$ )"
    - ... An error "Sub point setting error" (error code: 525) will occur at positioning start.
  - When the start point address is the same as the end point address
    - ... An error "End point setting error" (error code: 526) will occur.
  - When the start point address is the same as the sub point address
    - ... An error "Sub point setting error" (error code: 525) will occur.
  - When the end point address is the same as the sub point address
    - ... An error "Sub point setting error" (error code: 525) will occur.
  - When the start point address, sub point address, and end point address are in a straight line
    - ... An error "Sub point setting error" (error code: 525) will occur.

### ■ Positioning data setting example

[Reference axis and interpolation axis are designated as axis 1 and axis 2, respectively.]

The following table shows setting examples when "2-axis circular interpolation control with sub point designation (ABS circular sub)" is set in positioning data No. 1 of axis 1. (The required values are also set in positioning data No. 1 of axis 2.)

| Setting item                  |       | Axis                                | Axis 1<br>(reference<br>axis) setting<br>example | Axis 2<br>(interpolation<br>axis) setting<br>example | Setting details                                                                                                                         |
|-------------------------------|-------|-------------------------------------|--------------------------------------------------|------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------|
| Axis 1 Positioning data No. 1 | Da.1  | Operation pattern                   | Positioning complete                             | —                                                    | Set "Positioning complete" assuming the next positioning data will not be executed.                                                     |
|                               | Da.2  | Control system                      | ABS circular sub                                 | —                                                    | Set absolute system, 2-axis circular interpolation control with sub point designation.                                                  |
|                               | Da.3  | Acceleration time No.               | 1                                                | —                                                    | Designate the value set in " Pr.25 Acceleration time 1" as the acceleration time at start.                                              |
|                               | Da.4  | Deceleration time No.               | 0                                                | —                                                    | Designate the value set in " Pr.10 Deceleration time 0" as the deceleration time at deceleration.                                       |
|                               | Da.5  | Axis to be interpolated             | Axis 2                                           | —                                                    | Set the axis to be interpolated (partner axis). If the self-axis is set, an error will occur.                                           |
|                               | Da.6  | Positioning address/movement amount | 8000.0μm                                         | 6000.0μm                                             | Set the positioning address. (Assuming "mm" is set in " Pr.1 Unit setting".)                                                            |
|                               | Da.7  | Arc address                         | 4000.0μm                                         | 3000.0μm                                             | Set the sub point address. (Assuming that the " Pr.1 Unit setting" is set to "mm".)                                                     |
|                               | Da.8  | Command speed                       | 6000.00 mm/min                                   | —                                                    | Set the speed when moving to the end point address. (Designate the composite speed in " Pr.20 Interpolation speed designation method".) |
|                               | Da.9  | Dwell time                          | 500ms                                            | —                                                    | Set the time the machine dwells after the positioning stop (pulse output stop) to the output of the positioning complete signal.        |
|                               | Da.10 | M code                              | 10                                               | —                                                    | Set this when other sub operation commands are issued in combination with the No. 1 positioning data.                                   |

\* Refer to Section 5.3 "List of positioning data" for information on the setting details.

#### POINT

Set a value in " Da.8 Command speed" so that the speed of each axis does not exceed the " Pr.8 Speed limit value". (The speed limit does not function for the speed calculated by the QD75 during interpolation control.)

## [2] 2-axis circular interpolation control with sub point designation (INC circular sub)

### ■ Operation chart

In the incremental system, 2-axis circular interpolation control with sub point designation, positioning is carried out from the current stop position (start point address) to a position at the end of the movement amount set in " **Da.6** Positioning address/movement amount" in an arc path that passes through the sub point address set in " **Da.7** Arc address". The movement direction depends on the sign (+ or -) of the movement amount.

The resulting control path is an arc having as its center the intersection point of perpendicular bisectors of the straight line between the start point address (current stop position) and sub point address (arc address) calculated from the movement amount to the sub point, and a straight line between the sub point address (arc address) and end point address (positioning address) calculated from the movement amount to the end point.

### ■ Restrictions

- (1) 2-axis circular interpolation control cannot be set in the following cases.
  - When "degree" is set in " Pr.1 Unit setting"
  - When the units set in " Pr.1 Unit setting" are different for the reference axis and interpolation axis. ("mm" and "inch" combinations are possible.)
  - When "reference axis speed" is set in " Pr.20 Interpolation speed designation method"
- (2) An error will occur and the positioning start will not be possible in the following cases. The machine will immediately stop if the error is detected during positioning control.
  - When the radius exceeds "536870912 ( $=2^{29}$ )". (The maximum radius for which circular interpolation control is possible is "536870912 ( $=2^{29}$ )"  
 ... An error "Outside radius range" (error code: 544) will occur at positioning start.
  - When the auxiliary point address is outside the range of -2147483648 ( $-2^{31}$ ) to 2147483647 ( $2^{31}-1$ ).  
 ... An error "Sub point setting error" (error code: 525) will occur.
  - When the end point address is outside the range of -2147483648 ( $-2^{31}$ ) to 2147483647 ( $2^{31}-1$ ).  
 ... An error "End point setting error" (error code: 526) will occur.
  - When the auxiliary point address, center point address is outside the range of "-2147483648 ( $-2^{31}$ ) to 2147483647 ( $2^{31}-1$ )"  
 ... An error "Sub point setting error" (error code: 525) will occur at positioning start.
  - When the start point address is the same as the end point address  
 ... An error "End point setting error" (error code: 526) will occur.
  - When the start point address is the same as the sub point address  
 ... An error "Sub point setting error" (error code: 525) will occur.
  - When the end point address is the same as the sub point address  
 ... An error "Sub point setting error" (error code: 525) will occur.
  - When the start point address, sub point address, and end point address are in a straight line  
 ... An error "Sub point setting error" (error code: 525) will occur.

### ■ Positioning data setting example

[Reference axis and interpolation axis are designated as axis 1 and axis 2, respectively.]

The following table shows setting examples when "2-axis circular interpolation control with sub point designation (INC circular sub)" is set in positioning data No. 1 of axis 1. (The required values are also set in positioning data No. 1 of axis 2.)

| Setting item                  |       | Axis                                | Axis 1<br>(reference<br>axis) setting<br>example | Axis 2<br>(interpolation<br>axis) setting<br>example | Setting details                                                                                                                  |
|-------------------------------|-------|-------------------------------------|--------------------------------------------------|------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------|
| Axis 1 Positioning data No. 1 | Da.1  | Operation pattern                   | Positioning complete                             | —                                                    | Set "Positioning complete" assuming the next positioning data will not be executed.                                              |
|                               | Da.2  | Control system                      | INC circular sub                                 | —                                                    | Set incremental system, 2-axis circular interpolation control with sub point designation.                                        |
|                               | Da.3  | Acceleration time No.               | 1                                                | —                                                    | Designate the value set in " Pr.25 Acceleration time 1" as the acceleration time at start.                                       |
|                               | Da.4  | Deceleration time No.               | 0                                                | —                                                    | Designate the value set in " Pr.10 Deceleration time 0" as the deceleration time at deceleration.                                |
|                               | Da.5  | Axis to be interpolated             | Axis 2                                           | —                                                    | Set the axis to be interpolated (partner axis).<br>If the self-axis is set, an error will occur.                                 |
|                               | Da.6  | Positioning address/movement amount | 8000.0μm                                         | 6000.0μm                                             | Set the movement amount. (Assuming that the " Pr.1 Unit setting" is set to "mm".)                                                |
|                               | Da.7  | Arc address                         | 4000.0μm                                         | -3000.0μm                                            | Set the sub point address. |                               | Da.8  | Command speed                       | 6000.00 mm/min                                   | —                                                    | Set the speed during movement. (Designate the composite speed in " Pr.20 Interpolation speed designation method".)               |
|                               | Da.9  | Dwell time                          | 500ms                                            | —                                                    | Set the time the machine dwells after the positioning stop (pulse output stop) to the output of the positioning complete signal. |
|                               | Da.10 | M code                              | 10                                               | —                                                    | Set this when other sub operation commands are issued in combination with the No. 1 positioning data.                            |

\* Refer to Section 5.3 "List of positioning data" for information on the setting details.

#### POINT

Set a value in " Da.8 Command speed" so that the speed of each axis does not exceed the " Pr.8 Speed limit value". (The speed limit does not function for the speed calculated by the QD75 during interpolation control.)

## 9.2.11 2-axis circular interpolation control with center point designation

In "2-axis circular interpolation control" (" **Da.2** Control system" = ABS circular right, INC circular right, ABS circular left, INC circular left), two motors are used to carry out position control in an arc path having an arc address as a center point, while carrying out interpolation for the axis directions set in each axis.  
(Refer to Section 9.1.6 "Interpolation control" for details on interpolation control.)

The following table shows the rotation directions, arc center angles that can be controlled, and positioning paths for the different control systems.

| Control system     | Rotation direction | Arc center angle that can be controlled | Positioning path                                                                     |
|--------------------|--------------------|-----------------------------------------|--------------------------------------------------------------------------------------|
| ABS circular right | Clockwise          | $0^{\circ} < \theta \leq 360^{\circ}$   |    |
| INC circular right |                    |                                         |                                                                                      |
| ABS circular left  | Counterclockwise   |                                         |  |
| INC circular left  |                    |                                         |                                                                                      |

### ■ Circular interpolation error compensation

In circular interpolation control with center point designation, the arc path calculated from the start point address and center point address may deviate from the position of the end point address set in " [Da.6] Positioning address/movement amount".

(Refer to " [Pr.41] Allowable circular interpolation error width".)

- (1) Calculated error  $\leq$  " [Pr.41] Allowable circular interpolation error width"

Circular interpolation control to the set end point address is carried out while the error compensation is carried out. (This is called "spiral interpolation".)

In circular interpolation control with center point designation, an angular velocity is calculated on the assumption that operation is carried out at a command speed on the arc using the radius calculated from the start point address and center point address, and the radius is compensated in proportion to the angular velocity deviated from that at the start point.

Thus, when there is a difference (error) between a radius calculated from the start point address and center point address (start point radius) and a radius calculated from the end point address and center point address (end point radius), the composite speed differs from the command speed as follows.

- \* Start point radius > End point radius: As compared with the speed without error, the speed becomes slower as end point address is reached.
- \* Start point radius < End point radius: As compared with the speed without error, the speed becomes faster as end point address is reached.

- (2) Calculated error > " [Pr.41] Allowable circular interpolation error width"

At the positioning start, an error "Large arc error deviation" (error code: 506) will occur and the control will not start. The machine will immediately stop if the error is detected during positioning control.

# [1] 2-axis circular interpolation control with center point designation (ABS circular right, ABS circular left)

## ■ Operation chart

In the absolute system, 2-axis circular interpolation control with center point designation, positioning is carried out from the current stop position (start point address) to the address (end point address) set in " **Da.6** Positioning address/movement amount" in an arc path having as its center the address (arc address) of the center point set in " **Da.7** Arc address".

Positioning of a complete round with a radius from the start point address to the arc center point can be carried out by setting the end point address (positioning address) to the same address as the start point address.

In circular interpolation control with center point designation, an angular velocity is calculated on the assumption that operation is carried out at a command speed on the arc using the radius calculated from the start point address and center point address, and the radius is compensated in proportion to the angular velocity deviated from that at the start point.

Thus, when there is a difference (error) between a radius calculated from the start point address and center point address (start point radius) and a radius calculated from the end point address and center point address (end point radius), the composite speed differs from the command speed as follows.

- \* Start point radius > End point radius: As compared with the speed without error, the speed becomes slower as end point address is reached.
- \* Start point radius < End point radius: As compared with the speed without error, the speed becomes faster as end point address is reached.

#### ■ Restrictions

- (1) 2-axis circular interpolation control cannot be set in the following cases.
  - When "degree" is set in " Pr.1 Unit setting"
  - When the units set in " Pr.1 Unit setting" are different for the reference axis and interpolation axis. ("mm" and "inch" combinations are possible.)
  - When "reference axis speed" is set in " Pr.20 Interpolation speed designation method"
- (2) An error will occur and the positioning start will not be possible in the following cases. The machine will immediately stop if the error is detected during positioning control.
  - When the radius exceeds "536870912 ( $=2^{29}$ )". (The maximum radius for which circular interpolation control is possible is "536870912 ( $=2^{29}$ )"  
... An error "Outside radius range" (error code: 544) will occur at positioning start.
  - When the start point address is the same as the center point address  
... An error "Center point setting error" (error code: 527) will occur.
  - When the end point address is the same as the center point address  
... An error "Center point setting error" (error code: 527) will occur.
  - When the center point address is outside the range of  $-2147483648(-2^{31})$  to  $2147483647(2^{31}-1)$   
... An error "Center point setting error" (error code: 527) will occur.

### ■ Positioning data setting examples

[Reference axis and interpolation axis are designated as axis 1 and axis 2, respectively.]

The following table shows setting examples when "2-axis circular interpolation control with center point designation (ABS right arc, ABS left arc)" is set in positioning data No. 1 of axis 1. (The required values are also set in positioning data No. 1 of axis 2.)

| Setting item |                        | Axis                                    | Axis 1<br>(reference<br>axis) setting<br>example | Axis 2<br>(interpolation<br>axis) setting<br>example | Setting details                                                                                                                                            |
|--------------|------------------------|-----------------------------------------|--------------------------------------------------|------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Axis 1       | Positioning data No. 1 |                                         |                                                  |                                                      |                                                                                                                                                            |
|              | <a href="#">Da.1</a>   | Operation pattern                       | Positioning complete                             | —                                                    | Set "Positioning complete" assuming the next positioning data will not be executed.                                                                        |
|              | <a href="#">Da.2</a>   | Control system                          | ABS circular right<br>ABS circular left          | —                                                    | Set absolute system, 2-axis circular interpolation control with center point designation. (Select clockwise or counterclockwise according to the control.) |
|              | <a href="#">Da.3</a>   | Acceleration time No.                   | 1                                                | —                                                    | Designate the value set in " <a href="#">Pr.25</a> Acceleration time 1" as the acceleration time at start.                                                 |
|              | <a href="#">Da.4</a>   | Deceleration time No.                   | 0                                                | —                                                    | Designate the value set in " <a href="#">Pr.10</a> Deceleration time 0" as the deceleration time at deceleration.                                          |
|              | <a href="#">Da.5</a>   | Axis to be interpolated                 | Axis 2                                           | —                                                    | Set the axis to be interpolated (partner axis).<br>If the self-axis is set, an error will occur.                                                           |
|              | <a href="#">Da.6</a>   | Positioning address/<br>movement amount | 8000.0μm                                         | 6000.0μm                                             | Set the positioning address. (Assuming "mm" is set in " <a href="#">Pr.1</a> Unit setting".)                                                               |
|              | <a href="#">Da.7</a>   | Arc address                             | 4000.0μm                                         | 3000.0μm                                             | Set the arc address. (Assuming that the " <a href="#">Pr.1</a> Unit setting" is set to "mm".)                                                              |
|              | <a href="#">Da.8</a>   | Command speed                           | 6000.00<br>mm/min                                | —                                                    | Set the speed when moving to the end point address. (Designate the composite speed in " <a href="#">Pr.20</a> Interpolation speed designation method".)    |
|              | <a href="#">Da.9</a>   | Dwell time                              | 500ms                                            | —                                                    | Set the time the machine dwells after the positioning stop (pulse output stop) to the output of the positioning complete signal.                           |
|              | <a href="#">Da.10</a>  | M code                                  | 10                                               | —                                                    | Set this when other sub operation commands are issued in combination with the No. 1 positioning data.                                                      |

\* Refer to Section 5.3 "List of positioning data" for information on the setting details.

#### POINT

Set a value in " [Da.8](#) Command speed" so that the speed of each axis does not exceed the " [Pr.8](#) Speed limit value". (The speed limit does not function for the speed calculated by the QD75 during interpolation control.)

## [2] 2-axis circular interpolation control with center point designation (INC circular right, INC circular left)

### ■ Operation chart

In the incremental system, 2-axis circular interpolation control with center point designation, positioning is carried out from the current stop position (start point address) to a position at the end of the movement amount set in " **Da.6** Positioning address/movement amount" in an arc path having as its center the address (arc address) of the center point set in " **Da.7** Arc address".

Positioning of a complete round with a radius of the distance from the start point address to the arc center point can be carried out by setting the movement amount to "0".

In circular interpolation control with center point designation, an angular velocity is calculated on the assumption that operation is carried out at a command speed on the arc using the radius calculated from the start point address and center point address, and the radius is compensated in proportion to the angular velocity deviated from that at the start point.

Thus, when there is a difference (error) between a radius calculated from the start point address and center point address (start point radius) and a radius calculated from the end point address and center point address (end point radius), the composite speed differs from the command speed as follows.

- \* Start point radius > End point radius: As compared with the speed without error, the speed becomes slower as end point address is reached.
- \* Start point radius < End point radius: As compared with the speed without error, the speed becomes faster as end point address is reached.

### ■ Restrictions

(1) 2-axis circular interpolation control cannot be set in the following cases.

- When "degree" is set in " Pr.1 Unit setting"
- When the units set in " Pr.1 Unit setting" are different for the reference axis and interpolation axis. ("mm" and "inch" combinations are possible.)
- When "reference axis speed" is set in " Pr.20 Interpolation speed designation method"

(2) An error will occur and the positioning start will not be possible in the following cases. The machine will immediately stop if the error is detected during positioning control.

- When the radius exceeds "536870912 ( $=2^{29}$ )". (The maximum radius for which circular interpolation control is possible is "536870912 ( $=2^{29}$ )"  
... An error "Outside radius range" (error code: 544) will occur at positioning start.
- When the end point address is outside the range of  $-2147483648(-2^{31})$  to  $2147483647(2^{31}-1)$   
... An error "End point setting error" (error code: 526) will occur.
- When the start point address is the same as the center point address  
... An error "Center point setting error" (error code: 527) will occur.
- When the end point address is the same as the center point address  
... An error "Center point setting error" (error code: 527) will occur.
- When the center point address is outside the range of  $-2147483648(-2^{31})$  to  $2147483647(2^{31}-1)$   
... An error "Center point setting error" (error code: 527) will occur.

### ■ Positioning data setting examples

[Reference axis and interpolation axis are designated as axis 1 and axis 2, respectively.]

The following table shows setting examples when "2-axis circular interpolation control with center point designation (INC circular right, INC circular left)" is set in positioning data No. 1 of axis 1. (The required values are also set in positioning data No. 1 of axis 2.)

| Setting item |                        | Axis                                    | Axis 1<br>(reference<br>axis) setting<br>example | Axis 2<br>(interpolation<br>axis) setting<br>example | Setting details                                                                                                                                               |
|--------------|------------------------|-----------------------------------------|--------------------------------------------------|------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Axis 1       | Positioning data No. 1 |                                         |                                                  |                                                      |                                                                                                                                                               |
|              | <a href="#">Da.1</a>   | Operation pattern                       | Positioning complete                             | —                                                    | Set "Positioning complete" assuming the next positioning data will not be executed.                                                                           |
|              | <a href="#">Da.2</a>   | Control system                          | INC circular right<br>INC circular left          | —                                                    | Set incremental system, 2-axis circular interpolation control with center point designation. \* Refer to Section 5.3 "List of positioning data" for information on the setting details.

| POINT                                                                                                                                                                                                                                                     |
|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Set a value in " <a href="#">Da.8</a> Command speed" so that the speed of each axis does not exceed the " <a href="#">Pr.8</a> Speed limit value". (The speed limit does not function for the speed calculated by the QD75 during interpolation control.) |

## 9.2.12 3-axis helical interpolation control with sub point designation

In the 3-axis helical interpolation control, circular interpolation control is carried out with two of the three axes. The other axis tracks the movement of the circular interpolation control to carry out "helical control" or "tangential control". (\* Refer to Section 9.1.6 "Interpolation control" for interpolation control.)

| Control details    | Outline of control | Positioning path                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
|--------------------|--------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

The figure on the left shows an example of the control that keeps the direction of the workpiece in the tangential direction.</p> <p>■ Unit setting</p> <ul style="list-style-type: none"> <li>• Reference axis: mm/inch, pulse</li> <li>• Circular interpolation axis: Same setting as the one for the reference axis</li> <li>• Linear interpolation axis: degree</li> </ul> |

X-axis: Reference axis, Y-axis: Circular interpolation axis, Z-axis: Linear interpolation axis

■ Helical interpolation control speed

The command speed of the 3-axis helical interpolation control is the same as the speed of circular interpolation control (composite speed of reference axis and circular interpolation axis).

**POINT**

When "0: Composite speed" is set in "[Pr.20] Interpolation speed designation method", the command speed of ABS3/INC3 is the same as the composite speed of the 3 axes (x axis - y axis - z axis). The command speed of 3-axis helical interpolation control is the same as the composite speed of the circular interpolation axis (x axis - y axis). When continuous path control is carried out in ABS3/INC3 and 3-axis helical interpolation control, adjust the command speed to prevent the workpiece from moving unsteadily because the workpiece movement speed may change when positioning data is switched.

■ Rotation angle of the circular interpolation axis (X axis - Y axis)

The following shows the rotation angle of the circular interpolation axis in 3-axis helical interpolation control.

| Number of pitch | Circular interpolation axis control                                                 |  |
|-----------------|-------------------------------------------------------------------------------------|--|
|                 |  |  |
| 0               | $\theta^\circ$                                                                      |  |
| 1               | $360^\circ + \theta^\circ$                                                          |  |
| 2               | $720^\circ + \theta^\circ$                                                          |  |
| to              | to                                                                                  |  |
| n               | $360^\circ \times n + \theta^\circ$                                                 |  |
| to              | to                                                                                  |  |
| 999             | $360^\circ \times 999 + \theta^\circ$                                               |  |

**POINT**

When "degree" is set for the unit setting in the absolute system, the positioning range is 0 to 359.99999°. When the axis rotates 360° or more in circular interpolation control (x axis - y axis), the tangential/normal control cannot be carried out because a degree of 360° or more cannot be set in linear control (z axis: degree). To carry out tangential/normal control in which the axis rotates 360° or more, use 3-axis helical interpolation control (INC).

■ Rotation direction when the unit for the linear axis (z axis) is degree

When "[Pr.1] Unit setting" for the linear axis is "degree", the rotation direction is determined according to the axis control data "[Cd.40] ABS direction in degrees" of the reference axis. To set the rotation direction for each positioning data, set the position data "[Da.28] ABS direction in degrees".

# [1] 3-axis helical interpolation control with sub point designation (ABS helical sub)

## ■ Operation chart

In this control, positioning is carried out from the current stop position (X0, Y0, Z0) to the circular end address (X1, Y1) and linear axis end address (Z1) set in "[Da.6] Positioning address/movement amount". Circular interpolation where the arc path passes through the address of the sub point (sub point address) set in "[Da.7] Arc address" is carried out. Simultaneously, linear interpolation is carried out with the other linear axis. The control path is helically rotated for the number of pitch set in "[Da.10] M code" of the linear axis to complete the positioning to the specified position.

The resulting control path is an arc having its center as the intersection point of perpendicular bisectors of a straight line between the start point address (current stop position) and sub point address (arc address), and a straight line between the sub point address (arc address) and end point address (positioning address).

## ■ Restrictions

(1) In the following cases, 3-axis helical interpolation control cannot be set.

- When "degree" is set in "[Pr.1] Unit setting" for the reference axis and circular interpolation axis
- When the units set in "[Pr.1] Unit setting" are different between the reference axis and circular interpolation axis. ("mm" and "inch" combinations are possible.)
- When a method other than "composite speed" is set in "[Pr.20] Interpolation speed designation method" or "[Da.29] Interpolation speed designation method"

- (2) An error will occur and the positioning start will not be possible in the following cases. The machine will immediately stop if the error is detected during positioning control.
- When the radius exceeds " $536870912 (=2^{29})$ "  
(The maximum radius for which circular interpolation control is possible is " $536870912 (=2^{29})$ ".)  
... An error "Outside radius range" (error code: 544) will occur at positioning start.
  - When the center point address is outside the range of " $-2147483648 (-2^{31})$  to  $2147483647 (2^{31}-1)$ "  
... An error "Sub point setting error" (error code: 525) will occur at positioning start.
  - Start point address = End point address  
... Error "End point setting error" (error code: 526)
  - Start point address = Sub point address  
... Error "Sub point setting error" (error code: 525)
  - End point address = Sub point address  
... Error "Sub point setting error" (error code: 525)
  - When the start point address, end point address, and sub point address are in a straight line  
... Error "Sub point setting error" (error code: 525)

### ■ Positioning data setting example

[Reference axis, circular interpolation axis, and linear interpolation axis are specified as axis 1, axis 2, and axis 3, respectively.]

The following table shows setting examples when "helical interpolation control with sub point designation (ABS)" is set in positioning data No. 1 of axis 1.

(The required values are also set in positioning data No. 1 of axis 2 and axis 3.)

| Item \ Axis            |                                          | Axis 1<br>(reference axis) setting example | Axis 2 (circular interpolation axis) setting example | Axis 3 (linear interpolation axis) setting example | Setting details                                                                                                                                                          |
|------------------------|------------------------------------------|--------------------------------------------|------------------------------------------------------|----------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Positioning data No. 1 | Da.1 Operation pattern                   | Positioning complete                       | -                                                    | -                                                  | Set "Positioning complete" assuming that the next positioning data will not be executed.                                                                                 |

|                        | Da.10 M code                             | 10                                         | -                                                    | 50                                                 | Set this item when other sub operation commands are issued in combination with the No. 1 positioning data.<br>Set the number of pitch for the linear interpolation axis. |

\* Refer to Section 5.3 "List of positioning data" for information on the setting details.

#### POINT

Set a value in "[Da.8] Command speed" so that the speed of each axis does not exceed the "[Pr.8] Speed limit value". (The speed limit does not function for the speed calculated by the QD75N during interpolation control.)

## [2] 3-axis helical interpolation control with sub point designation (INC helical sub)

### ■ Operation chart

In this control, positioning is carried out from the current stop position (X0, Y0, Z0) to the movement amount position (X1, Y1, Z1) set in "[Da.6] Positioning address/movement amount". Circular interpolation where the arc path passes through the address of the sub point (sub point address) set in "[Da.7] Arc address" is carried out. Simultaneously, linear interpolation is carried out with the other linear axis. The control path is helically rotated for the number of pitch set in "[Da.10] M code" of the linear axis to complete the positioning to the specified position. The movement direction is determined by the sign of the movement amount.

The resulting control path is an arc having its center as the intersection point of perpendicular bisectors of the straight line between the start point address (current stop position) and sub point address (arc address) calculated from the movement amount to the sub point, and a straight line between the sub point address (arc address) and end point address (positioning address) calculated from the movement amount to the end point.

### ■ Restrictions

(1) In the following cases, 3-axis helical interpolation control cannot be set.

- When "degree" is set in "[Pr.1] Unit setting" for the reference axis and circular interpolation axis
- When the units set in "[Pr.1] Unit setting" are different between the reference axis and circular interpolation axis. ("mm" and "inch" combinations are possible.)
- When a method other than "composite speed" is set in "[Pr.20] Interpolation speed designation method" or "[Da.29] Interpolation speed designation method"

- (2) An error will occur and the positioning start will not be possible in the following cases. The machine will immediately stop if the error is detected during positioning control.
- When the radius exceeds "536870912 ( $=2^{29}$ )"  
(The maximum radius for which circular interpolation control is possible is "536870912 ( $=2^{29}$ )".)  
... An error "Outside radius range" (error code: 544) will occur at positioning start.
  - When the sub point address is outside the range of -2147483648 ( $-2^{31}$ ) to 2147483647 ( $2^{31}-1$ )  
... An error "Sub point setting error" (error code: 525) will occur at positioning start.
  - When the end point address is outside the range of -2147483648 ( $-2^{31}$ ) to 2147483647 ( $2^{31}-1$ )  
... An error "End point setting error" (error code: 526) will occur at positioning start.
  - When the center point address is outside the range of "-2147483648 ( $-2^{31}$ ) to 2147483647 ( $2^{31}-1$ )"  
... An error "Sub point setting error" (error code: 525) will occur at positioning start.
  - Start point address = End point address  
... Error "End point setting error" (error code: 526)
  - Start point address = Sub point address  
... Error "Sub point setting error" (error code: 525)
  - End point address = Sub point address  
... Error "Sub point setting error" (error code: 525)
  - When the start point address, end point address, and sub point address are in a straight line  
... Error "Sub point setting error" (error code: 525)

### ■ Positioning data setting example

[Reference axis, circular interpolation axis, and linear interpolation axis are specified as axis 1, axis 2, and axis 3, respectively.]

The following table shows setting examples when "helical interpolation control with sub point designation (INC)" is set in positioning data No. 1 of axis 1.

(The required values are also set in positioning data No. 1 of axis 2 and axis 3.)

| Item                   |       | Axis                                 | Axis 1<br>(reference axis)<br>setting example | Axis 2 (circular<br>interpolation<br>axis) setting<br>example | Axis 3 (linear<br>interpolation<br>axis) setting<br>example | Setting details                                                                                                                                                          |
|------------------------|-------|--------------------------------------|-----------------------------------------------|---------------------------------------------------------------|-------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Positioning data No. 1 | Da.1  | Operation pattern                    | Positioning complete                          | -                                                             | -                                                           | Set "Positioning complete" assuming that the next positioning data will not be executed.                                                                                 |

|                        | Da.10 | M code                               | 10                                            | -                                                             | 50                                                          | Set this item when other sub operation commands are issued in combination with the No. 1 positioning data.<br>Set the number of pitch for the linear interpolation axis. |

\* Refer to Section 5.3 "List of positioning data" for information on the setting details.

#### POINT

Set a value in "[Da.8] Command speed" so that the speed of each axis does not exceed the "[Pr.8] Speed limit value". (The speed limit does not function for the speed calculated by the QD75N during interpolation control.)

## 9.2.13 3-axis helical interpolation control with center point designation

In the 3-axis helical interpolation control, circular interpolation control is carried out with two of the three axes. The other axis tracks the movement of the circular interpolation control to carry out "helical control" or "tangential control". (Refer to Section 9.1.6 "Interpolation control" for interpolation control.)

| Control details    | Outline of control | Positioning path                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|--------------------|--------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Helical control    |                    | <p>In this control, the linear interpolation axis (linear control) tracks the movement of circular interpolation control, and a helical path is drawn.</p> <p>■ Unit setting</p> <ul style="list-style-type: none"> <li>Reference axis: mm/inch, pulse</li> <li>Circular interpolation axis: Same setting as the one for the reference axis</li> <li>Linear interpolation axis: mm/inch, pulse</li> </ul>                                                                                                                                                                                                            |

X-axis: Reference axis, Y-axis: Circular interpolation axis, Z-axis: Linear interpolation axis

■ Helical interpolation control speed

The command speed of the 3-axis helical interpolation control is the same as the speed of circular interpolation control (composite speed of reference axis and circular interpolation axis).

**POINT**

When "0: Composite speed" is set in "[Pr.20] Interpolation speed designation method", the command speed of ABS3/INC3 is the same as the composite speed of the 3 axes (x axis - y axis - z axis). The command speed of 3-axis helical interpolation control is the same as the composite speed of the circular interpolation axis (x axis - y axis). When continuous path control is carried out in ABS3/INC3 and 3-axis helical interpolation control, adjust the command speed to prevent the workpiece from moving unsteadily because the workpiece movement speed may change when positioning data is switched.

■ Rotation angle of the circular interpolation axis (X axis - Y axis)

The following shows the rotation angle of the circular interpolation axis in 3-axis helical interpolation control.

| Number of pitch | Circular interpolation axis control                                                |                                                                                     |
|-----------------|------------------------------------------------------------------------------------|-------------------------------------------------------------------------------------|
|                 | True circle                                                                        | Other than true circle                                                              |

| n               | 360° × n                                                                           | 360° × n + θ°                                                                       |
| to              | to                                                                                 | to                                                                                  |
| 999             | 360° × 999                                                                         | 360° × 999 + θ°                                                                     |

A true circle can be set only when the start point equals to the end point in 3-axis helical interpolation (ABS/INC, center point).

**POINT**

When "degree" is set for the unit setting in the absolute system, the positioning range is 0 to 359.99999°. When the axis rotates 360° or more in circular interpolation control (x axis - y axis), the tangential/normal control cannot be carried out because a degree of 360° or more cannot be set in linear control (z axis: degree). To carry out tangential/normal control in which the axis rotates 360° or more, use 3-axis helical interpolation control (INC).

### ■ Rotation angle of the circular interpolation axis (X axis - Y axis)

In 3-axis helical interpolation control, "[Pr.41] Allowable circular interpolation error width" is made valid as well as in circular interpolation control (2 axes). When a circular interpolation error occurs, the path of the circular interpolation control (x axis - y axis) forms a spiral as shown below.

### ■ Rotation direction when the unit for the linear axis (z axis) is degree

When "[Pr.1] Unit setting" for the linear axis is "degree", the rotation direction is determined according to the axis control data "[Cd.40] ABS direction in degrees" of the reference axis. To set the rotation direction for each positioning data, set the position data "[Da.28] ABS direction in degrees".

[1] 3-axis helical interpolation control with center point designation  
(ABS helical right, ABS helical left)

■ Operation chart

In this control, positioning is carried out from the current stop position (X0, Y0, Z0) to the circular end address (X1, Y1) and linear axis end address (Z1) set in "Da.6 Positioning address/movement amount". Circular interpolation with an arc path having its center as the address of the center point (arc address) set in "Da.7 Arc address" is carried out. Simultaneously, linear interpolation is carried out with the other linear axis. The control path is helically rotated for the number of pitch set in "Da.10 M code" of the linear axis to complete the positioning to the specified position.

Positioning of a true circle with a radius of the distance from the start point address to the arc center point can be carried out by setting the end point address (positioning address) of the circular interpolation axis to the same address as the start point address.

**■ Restrictions**

- (1) In the following cases, 3-axis helical interpolation control cannot be set.
- When "degree" is set in "[Pr.1] Unit setting" for the reference axis and circular interpolation axis
  - When the units set in "[Pr.1] Unit setting" are different between the reference axis and circular interpolation axis. ("mm" and "inch" combinations are possible.)
  - When the "reference axis speed" is set in "[Pr.20] Interpolation speed designation method" or "[Da.29] Interpolation speed designation method"
- (2) An error will occur and the positioning start will not be possible in the following cases. The machine will immediately stop if the error is detected during positioning control.
- When the radius exceeds " $536870912 (=2^{29})$ "  
(The maximum radius for which circular interpolation control is possible is " $536870912 (=2^{29})$ ".)
    - ... An error "Outside radius range" (error code: 544) will occur at positioning start.
  - Start point address = Center point address
    - ... Error "Center point setting error" (error code: 527)
  - End point address = Center point address
    - ... Error "Center point setting error" (error code: 527)
  - When the center point address is outside the range of " $-2147483648 (-2^{31})$  to  $2147483647 (2^{31}-1)$ "
    - ... Error "Center point setting error" (error code: 527)

### ■ Positioning data setting example

[Reference axis, circular interpolation axis, and linear interpolation axis are specified as axis 1, axis 2, and axis 3, respectively.]

The following table shows setting examples when "helical interpolation control with center point designation (ABS helical right, ABS helical left)" is set in positioning data No. 1 of axis 1.

(The required values are also set in positioning data No. 1 of axis 2 and axis 3.)

| Item \ Axis            |       |                                      | Axis 1<br>(reference axis) setting example | Axis 2<br>(circular interpolation axis) setting example | Axis 3 (linear interpolation axis) setting example | Setting details                                                                                                                                                          |
|------------------------|-------|--------------------------------------|--------------------------------------------|---------------------------------------------------------|----------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

|                        | Da.10 | M code                               | 10                                         | -                                                       | 50                                                 | Set this item when other sub operation commands are issued in combination with the No. 1 positioning data.<br>Set the number of pitch for the linear interpolation axis. |

\* Refer to Section 5.3 "List of positioning data" for information on the setting details.

#### POINT

Set a value in "[Da.8] Command speed" so that the speed of each axis does not exceed the "[Pr.8] Speed limit value". (The speed limit does not function for the speed calculated by the QD75N during interpolation control.)

[1] 3-axis helical interpolation control with center point designation  
(INC helical right, INC helical left)

■ Operation chart

In this control, positioning is carried out from the current stop position (X0, Y0, Z0) to the movement amount position (X1, Y1, Z1) set in "[Da.6] Positioning address/movement amount". Circular interpolation with an arc path having its center as the address of the center point (arc address) set in "[Da.7] Arc address" is carried out. Simultaneously, linear interpolation is carried out with the other linear axis. The control path is helically rotated for the number of pitch set in "[Da.10] M code" of the linear axis to complete the positioning to the specified position.

Positioning of a true circle with a radius of the distance from the start point address to the arc center point can be carried out by setting the movement amount of the circular interpolation axis to "0".

### ■ Restrictions

- (1) In the following cases, 3-axis helical interpolation control cannot be set.
  - When "degree" is set in "[Pr.1] Unit setting" for the reference axis and circular interpolation axis
  - When the units set in "[Pr.1] Unit setting" are different between the reference axis and circular interpolation axis. ("mm" and "inch" combinations are possible.)
  - When the "reference axis speed" is set in "[Pr.20] Interpolation speed designation method" or "[Da.29] Interpolation speed designation method"
- (2) An error will occur and the positioning start will not be possible in the following cases. The machine will immediately stop if the error is detected during positioning control.
  - When the radius exceeds "536870912 ( $=2^{29}$ )"  
 (The maximum radius for which circular interpolation control is possible is "536870912 ( $=2^{29}$ )".)  
 ... An error "Outside radius range" (error code: 544) will occur at positioning start.
  - When the end point address is outside the range of  $-2147483648 (-2^{31})$  to  $2147483647 (2^{31}-1)$   
 ... An error "End point setting error" (error code: 526) will occur at positioning start.
  - Start point address = Center point address  
 ... Error "Center point setting error" (error code: 527)
  - End point address = Center point address  
 ... Error "Center point setting error" (error code: 527)
  - When the center point address is outside the range of  $-2147483648 (-2^{31})$  to  $2147483647 (2^{31}-1)$   
 ... Error "Center point setting error" (error code: 527)

### ■ Positioning data setting example

[Reference axis, circular interpolation axis, and linear interpolation axis are specified as axis 1, axis 2, and axis 3, respectively.]

The following table shows setting examples when "helical interpolation control with center point designation (INC helical right, INC helical left)" is set in positioning data No. 1 of axis 1.

(The required values are also set in positioning data No. 1 of axis 2 and axis 3.)

| Item \ Axis            |       |                                      | Axis 1<br>(reference axis) setting example | Axis 2 (circular interpolation axis) setting example | Axis 3 (linear interpolation axis) setting example | Setting details                                                                                                                                                          |

(Assuming "mm" is set in "Pr.1 Unit setting".)                                                                                                      |
|                        | Da.8  | Command speed                        | 6000.00mm/min                              | -                                                    | -                                                  | Set the speed during movement to the end point address. (Set the composite speed in "Pr.20 Interpolation speed designation method".)                                     |
|                        | Da.9  | Dwell time                           | 500ms                                      | -                                                    | -                                                  | Set the time the machine dwells from the positioning stop (pulse output stop) to the output of the positioning complete signal.                                          |
|                        | Da.10 | M code                               | 10                                         | -                                                    | 50                                                 | Set this item when other sub operation commands are issued in combination with the No. 1 positioning data.<br>Set the number of pitch for the linear interpolation axis. |

\* Refer to Section 5.3 "List of positioning data" for information on the setting details.

#### POINT

Set a value in "[Da.8] Command speed" so that the speed of each axis does not exceed the "[Pr.8] Speed limit value". (The speed limit does not function for the speed calculated by the QD75N during interpolation control.)

## 9.2.14 1-axis speed control

In "1-axis speed control" (" [Da.2] Control system" = Forward run: speed 1, Reverse run: speed 1), control is carried out in the axis direction in which the positioning data has been set by continuously outputting pulses for the speed set in

" [Da.8] Command speed" until the input of a stop command.

The two types of 1-axis speed control are "Forward run: speed 1" in which the control starts in the forward run direction, and "Reverse run: speed 1" in which control starts in the reverse run direction.

#### ■ Operation chart

The following chart shows the operation timing for 1-axis speed control with axis 1 as the reference axis.

The "in speed control" flag ([Md.31] Status: b0) is turned ON during speed control.

The "Positioning complete signal" is not turned ON.

Fig.9.9 1-axis speed control operation timing

### ■ Current feed value during 1-axis speed control

The following table shows the " **Md.20** Current feed value" during 1-axis speed control corresponding to the " **Pr.21** Current feed value during speed control" settings.

| " <b>Pr.21</b> Current feed value during speed control" setting | <b>Md.20</b> Current feed value                              |
|-----------------------------------------------------------------|--------------------------------------------------------------|
| 0: Do not update current feed value                             | The current feed value at speed control start is maintained. |
| 1: Update current feed value                                    | The current feed value is updated.                           |
| 2: Zero clear current feed value                                | The current feed value is fixed at 0.                        |

### ■ Restrictions

- (1) Set "Positioning complete" in " **Da.1** Operation pattern". An axis error "Continuous path control not possible" (error code: 516) will occur and the operation cannot start if "continuous positioning control" or "continuous path control" is set in " **Da.1** Operation pattern". ("Continuous positioning control" and "continuous path control" cannot be set in speed control.)
- (2) Set the WITH mode in " **Pr.18** M code ON signal output timing" when using an M code. The M code will not be output, and the M code ON signal will not turn ON if the AFTER mode is set.
- (3) An error "No command speed" (error code: 503) will occur if the current speed (-1) is set in " **Da.8** Command speed".
- (4) The software stroke limit check will not be carried out if the control unit is set to "degree".

### ■ Positioning data setting examples

The following table shows the setting examples when "1-axis speed control (forward run: speed 1)" is set in the positioning data No. 1 of axis 1.

| Setting item |                        | Setting example                     | Setting details                                                                                                                                                                         |
|--------------|------------------------|-------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Axis 1       | Positioning data No. 1 |                                     |                                                                                                                                                                                         |
|              | Da.1                   | Operation pattern                   | Positioning complete                                                                                                                                                                    |
|              |                        |                                     | Setting other than "Positioning complete" is not possible in speed control.                                                                                                             |
|              | Da.2                   | Control system                      | Forward run speed 1                                                                                                                                                                     |
|              |                        |                                     | Set 1-axis speed control.                                                                                                                                                               |
|              | Da.3                   | Acceleration time No.               | 1                                                                                                                                                                                       |
|              |                        |                                     | Designate the value set in " Pr.25 Acceleration time 1" as the acceleration time at start.                                                                                              |
|              | Da.4                   | Deceleration time No.               | 0                                                                                                                                                                                       |
|              |                        |                                     | Designate the value set in " Pr.10 Deceleration time 0" as the deceleration time at deceleration.                                                                                       |

|              | Da.8                   | Command speed                       | 6000.00mm/min                                                                                                                                                                           |
|              |                        |                                     | Set the speed to be commanded.                                                                                                                                                          |
|              | Da.9                   | Dwell time                          | –                                                                                                                                                                                       |
|              |                        |                                     | Setting not required (setting value will be ignored).                                                                                                                                   |
|              | Da.10                  | M code                              | 10                                                                                                                                                                                      |
|              |                        |                                     | Set this when other sub operation commands are issued in combination with the No. 1 positioning data. (" Pr.18 M code ON signal output timing" setting only possible in the WITH mode.) |

\* Refer to Section 5.3 "List of positioning data" for information on the setting details.

## 9.2.15 2-axis speed control

In "2-axis speed control" (" [Da.2] Control system" = Forward run: speed 2, Reverse run: speed 2), control is carried out in the 2-axis direction in which the positioning data has been set by continuously outputting pulses for the speed set in " [Da.8] Command speed" until the input of a stop command.

The two types of 2-axis speed control are "Forward run: speed 2" in which the control starts in the forward run direction, and "Reverse run: speed 2" in which control starts in the reverse run direction.

(Refer to Section 9.1.6 "Interpolation control" for the combination of the reference axis with the interpolation axis.)

#### ■ Operation chart

The following chart shows the operation timing for 2-axis (axes 1 and 2) speed control with axis 1 as the reference axis. The "in speed control" flag ([Md.31] Status: b0) is turned ON during speed control.

The "positioning complete signal" is not turned ON.

Fig. 9.10 2-axis speed control operation timing

### ■ Current feed value during 2-axis speed control

The following table shows the " [Md.20] Current feed value" during 2-axis speed control corresponding to the " [Pr.21] Current feed value during speed control" settings. (Note that the reference axis setting values are used for parameters.)

| " [Pr.21] Current feed value during speed control" setting | [Md.20] Current feed value                                   |
|------------------------------------------------------------|--------------------------------------------------------------|
| 0: Do not update current feed value                        | The current feed value at speed control start is maintained. |
| 1: Update current feed value                               | The current feed value is updated.                           |
| 2: Zero clear current feed value                           | The current feed value is fixed at 0.                        |

### ■ Restrictions

- (1) Set "Positioning complete" in " [Da.1] Operation pattern". An axis error "Continuous path control not possible" (error code: 516) will occur and the operation cannot start if "continuous positioning control" or "continuous path control" is set.  
("Continuous positioning control" and "continuous path control" cannot be set in speed control.)
- (2) Set the WITH mode in " [Pr.18] M code ON signal output timing" when using an M code. The M code will not be output, and the M code ON signal will not turn ON if the AFTER mode is set.
- (3) Set the "reference axis speed" in " [Pr.20] Interpolation speed designation method". An error "Interpolation mode error" (error code: 523) will occur and the operation cannot start if a composite speed is set.
- (4) When either of two axes exceeds the speed limit, that axis is controlled with the speed limit value. The speeds of the other axes are limited at the ratios of " [Da.8] Command speed".  
(Examples)

| Axis         |                   | Axis 1 setting | Axis 2 setting |
|--------------|-------------------|----------------|----------------|
| Setting item |                   |                |                |
| [Pr.8]       | Speed limit value | 4000.00mm/min  | 5000.00mm/min  |
| [Da.8]       | Command speed     | 8000.00mm/min  | 6000.00mm/min  |

With the settings shown above, the operation speed in speed control is as follows.

Axis 1: 4000.00 mm/min (Speed is limited by [Pr.8]).

Axis 2: 3000.00 mm/min (Speed is limited at a ratio of an axis 1 command speed to an axis 2 command speed).

Note: Operation runs at speed 1 when a reference axis speed is less than 1 as a result of speed limit.

In addition, when a bias speed is set, it will be the minimum speed.

- (5) An error "No command speed" (error code: 503) occurs if a current speed (-1) is set in " **Da.8** Command speed".
- (6) The software stroke limit check is not carried out when the control unit is set to "degree".

#### ■ Positioning data setting examples

[Setting examples when the reference axis and interpolation axis are designated as axes 1 and 2, respectively.]

The following table shows the setting examples when "2-axis speed control (forward run: speed 2)" is set in the positioning data No. 1 of axis 1 (reference axis).

| Setting item |                        | Axis                                | Axis 1<br>(reference<br>axis) setting<br>example | Axis 2<br>(interpolation<br>axis) setting<br>example | Setting details                                                                                                                                                                                |

|              | <b>Da.8</b>            | Command speed                       | 6000.00 mm/min                                   | 3000.00 mm/min                                       | Set the speed to be commanded.                                                                                                                                                                 |
|              | <b>Da.9</b>            | Dwell time                          | —                                                | —                                                    | Setting not required (setting value will be ignored).                                                                                                                                          |
|              | <b>Da.10</b>           | M code                              | 10                                               | —                                                    | Set this when other sub operation commands are issued in combination with the No. 1 positioning data. (" <b>Pr.18</b> M code ON signal output timing" setting only possible in the WITH mode.) |

\* Refer to Section 5.3 "List of positioning data" for information on the setting details.

## 9.2.16 3-axis speed control

In "3-axis speed control" (" [Da.2] Control system" = Forward run: speed 3, Reverse run: speed 3), control is carried out in the 3-axis direction in which the positioning data has been set by continuously outputting pulses for the speed set in

" [Da.8] Command speed" until the input of a stop command.

The two types of 3-axis speed control are "Forward run: speed 3" in which the control starts in the forward run direction, and "Reverse run: speed 3" in which control starts in the reverse run direction.

(Refer to Section 9.1.6 "Interpolation control" for the combination of the reference axis with the interpolation axes.)

#### ■ Operation chart

The following chart shows the operation timing for 3-axis (axes 1, 2, and 3) speed control with axis 1 as the reference axis.

The "in speed control" flag ([Md.31] Status: b0) is turned ON during speed control.

The "positioning complete signal" is not turned ON.

Fig. 9.11 3-axis speed control operation timing

### ■ Current feed value during 3-axis speed control

The following table shows the " [Md.20](#) Current feed value" during 3-axis speed control corresponding to the " [Pr.21](#) Current feed value during speed control" settings. (Note that the reference axis setting values are used for parameters.)

| " <a href="#">Pr.21</a> Current feed value during speed control" setting | <a href="#">Md.20</a> Current feed value                     |
|--------------------------------------------------------------------------|--------------------------------------------------------------|
| 0: Do not update current feed value                                      | The current feed value at speed control start is maintained. |
| 1: Update current feed value                                             | The current feed value is updated.                           |
| 2: Zero clear current feed value                                         | The current feed value is fixed at 0.                        |

### ■ Restrictions

- (1) Set "Positioning complete" in " [Da.1](#) Operation pattern". An axis error "Continuous path control not possible" (error code: 516) will occur and the operation cannot start if "continuous positioning control" or "continuous path control" is set. ("Continuous positioning control" and "continuous path control" cannot be set in speed control.)
- (2) Set the WITH mode in " [Pr.18](#) M code ON signal output timing" when using an M code. The M code will not be output, and the M code ON signal will not turn ON if the AFTER mode is set.
- (3) Set the "reference axis speed" in " [Pr.20](#) Interpolation speed designation method". An error "Interpolation mode error" (error code: 523) will occur and the operation cannot start if a composite speed is set.

- (4) When either of three axes exceeds the speed limit, that axis is controlled with the speed limit value. The speeds of the other axes are limited at the ratios of " [Da.8] Command speed".

(Examples)

| Setting item \ Axis |                   | Axis 1 setting | Axis 2 setting | Axis 3 setting |
|---------------------|-------------------|----------------|----------------|----------------|
| [Pr.8]              | Speed limit value | 4000.00mm/min  | 5000.00mm/min  | 6000.00mm/min  |
| [Da.8]              | Command speed     | 8000.00mm/min  | 6000.00mm/min  | 4000.00mm/min  |

With the settings shown above, the operation speed in speed control is as follows.

Axis 1: 4000.00 mm/min (Speed is limited by [Pr.8]).

Axis 2: 3000.00 mm/min (Speed is limited at ratios in axes 1, 2, and 3 command speeds).

Axis 3: 2000.00 mm/min (Speed is limited at ratios in axes 1, 2, and 3 command speeds).

Note: Operation runs at speed 1 when a reference axis speed is less than 1 as a result of speed limit.

In addition, when a bias speed is set, it will be the minimum speed.

- (5) An error "No command speed" (error code: 503) will occur if a current speed (-1) is set in " [Da.8] Command speed".
- (6) The software stroke limit check is not carried out when the control unit is set to "degree".

### ■ Positioning data setting examples

The following table shows the setting examples when "3-axis speed control (forward run: speed 3)" is set in the positioning data No. 1 of axis 1 (reference axis).

| Setting item \ Axis              |                                          | Axis 1<br>(reference axis) setting example | Axis 2<br>(interpolation axis) setting example | Axis 3<br>(interpolation axis) setting example | Setting details                                                                                                                                                                         |

|                                  | Da.7 Arc address                         | —                                          | —                                              | —                                              | Setting not required (setting value will be ignored).                                                                                                                                   |
|                                  | Da.8 Command speed                       | 6000.00 mm/min                             | 3000.00 mm/min                                 | 2000.00 mm/min                                 | Set the speed to be commanded.                                                                                                                                                          |
|                                  | Da.9 Dwell time                          | —                                          | —                                              | —                                              | Setting not required (setting value will be ignored).                                                                                                                                   |
|                                  | Da.10 M code                             | 10                                         | —                                              | —                                              | Set this when other sub operation commands are issued in combination with the No. 1 positioning data. (" Pr.18 M code ON signal output timing" setting only possible in the WITH mode.) |

\* Refer to Section 5.3 "List of positioning data" for information on the setting details.

## 9.2.17 4-axis speed control

In "4-axis speed control" (" Da.2 Control system" = Forward run: speed 4, Reverse run: speed 4), control is carried out in the 4-axis direction in which the positioning data has been set by continuously outputting pulses for the speed set in

" Da.8 Command speed" until the input of a stop command.

The two types of 4-axis speed control are "Forward run: speed 4" in which the control starts in the forward run direction, and "Reverse run: speed 4" in which control starts in the reverse run direction.

(Refer to Section 9.1.6 "Interpolation control" for the combination of the reference axis with the interpolation axes.)

### ■ Operation chart

The following chart shows the operation timing for 4-axis speed control with axis 1 as the reference axis.

The "in speed control" flag ([Md.31] Status: b0) is turned ON during speed control.  
The "positioning complete signal" is not turned ON.

Fig. 9.12 4-axis speed control operation timing

### ■ Current feed value during 4-axis speed control

The following table shows the " [Md.20](#) Current feed value" during 4-axis speed control corresponding to the " [Pr.21](#) Current feed value during speed control" settings. (Note that the reference axis setting values are used for parameters.)

| " <a href="#">Pr.21</a> Current feed value during speed control" setting | <a href="#">Md.20</a> Current feed value                     |
|--------------------------------------------------------------------------|--------------------------------------------------------------|
| 0: Do not update current feed value                                      | The current feed value at speed control start is maintained. |
| 1: Update current feed value                                             | The current feed value is updated.                           |
| 2: Zero clear current feed value                                         | The current feed value is fixed at 0.                        |

### ■ Restrictions

- (1) Set "Positioning complete" in " [Da.1](#) Operation pattern". An axis error "Continuous path control not possible" (error code: 516) will occur and the operation cannot start if "continuous positioning control" or "continuous path control" is set. ("Continuous positioning control" and "continuous path control" cannot be set in speed control.)
- (2) Set the WITH mode in " [Pr.18](#) M code ON signal output timing" when using an M code. The M code will not be output, and the M code ON signal will not turn ON if the AFTER mode is set.
- (3) Set the "reference axis speed" in " [Pr.20](#) Interpolation speed designation method". An error "Interpolation mode error" (error code: 523) will occur and the operation cannot start if a composite speed is set.

- (4) When either of four axes exceeds the speed limit, that axis is controlled with the speed limit value. The speeds of the other axes are limited at the ratios of "Da.8 Command speed".

(Examples)

| Setting item \ Axis |                   | Axis 1 setting | Axis 2 setting | Axis 3 setting | Axis 4 setting |
|---------------------|-------------------|----------------|----------------|----------------|----------------|
| Pr.8                | Speed limit value | 4000.00mm/min  | 5000.00mm/min  | 6000.00mm/min  | 8000.00mm/min  |
| Da.8                | Command speed     | 8000.00mm/min  | 6000.00mm/min  | 4000.00mm/min  | 1500.00mm/min  |

With the settings shown above, the operation speed in speed control is as follows.

Axis 1: 4000.00 mm/min (Speed is limited by Pr.8).

Axis 2: 3000.00 mm/min (Speed is limited at ratios in axes 1, 2, 3 and 4 command speeds).

Axis 3: 2000.00 mm/min (Speed is limited at ratios in axes 1, 2, 3 and 4 command speeds).

Axis 4: 750.00 mm/min (Speed is limited at ratios in axes 1, 2, 3 and 4 command speeds).

Note: Operation runs at speed 1 when a reference axis speed is less than 1 as a result of speed limit.

In addition, when a bias speed is set, it will be the minimum speed.

- (5) An error "No command speed" (error code: 503) will occur if a current speed (-1) is set in "Da.8 Command speed".
- (6) The software stroke limit check is not carried out when the control unit is set to "degree".

### ■ Positioning data setting examples

The following table shows the setting examples when "4-axis speed control (forward run: speed 4)" is set in the positioning data No. 1 of axis 1 (reference axis).

| Setting item \ Axis           |                                          | Axis 1<br>(reference axis) setting example | Axis 2<br>(interpolation axis) setting example | Axis 3<br>(interpolation axis) setting example | Axis 4<br>(interpolation axis) setting example | Setting details                                                                                                                                                                            |
|-------------------------------|------------------------------------------|--------------------------------------------|------------------------------------------------|------------------------------------------------|------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Axis 1 Positioning data No. 1 | Da.1 Operation pattern                   | Positioning complete                       | —                                              | —                                              | —                                              | Setting other than "Positioning complete" is not possible in speed control.                                                                                                                |

|                               | Da.10 M code                             | 10                                         | —                                              | —                                              | —                                              | Set this when other sub operation commands are issued in combination with the No. 1 positioning data.<br>(" Pr.18 M code ON signal output timing" setting only possible in the WITH mode.) |

\* Refer to Section 5.3 "List of positioning data" for information on the setting details.

## 9.2.18 Speed-position switching control (INC mode)

In "speed-position switching control (INC mode)" (" **Da.2** Control system" = Forward run: speed/position, Reverse run: speed/position), the pulses of the speed set in " **Da.8** Command speed" are kept output on the axial direction set to the positioning data. When the "speed-position switching signal" is input, position control of the movement amount set in " **Da.6** Positioning address/movement amount" is exercised.

"Speed-position switching control (INC mode)" is available in two different types: "forward run: speed/position" which starts the axis in the forward run direction and "reverse run: speed/position" which starts the axis in the reverse run direction.

Use the detailed parameter 1 " **Pr.150** Speed-position function selection" with regard to the choice for "speed-position switching control (INC mode)".

| Setting item  |                                   | Setting value | Setting details                             | Buffer memory address |        |        |        |
|---------------|-----------------------------------|---------------|---------------------------------------------|-----------------------|--------|--------|--------|
|               |                                   |               |                                             | Axis 1                | Axis 2 | Axis 3 | Axis 4 |
| <b>Pr.150</b> | Speed-position function selection | 0             | Speed-position switching control (INC mode) | 34                    | 184    | 334    | 484    |

\* If the set value is other than 0 and 2, it is regarded as 0 and operation is performed in the INC mode.  
For details of the setting, refer to Section 5.2 "List of parameters".

#### ■ Switching over from speed control to position control

- (1) The control is switched over from speed control to position control by executing the external command signal set in "speed-position switching signal".
- (2) Besides setting the positioning data, the " **Cd.24** Speed-position switching enable flag" must also be turned ON to switch over from speed control to position control. (If the " **Cd.24** Speed-position switching enable flag" turns ON after the speed-position switching signal turns ON, the control will continue as speed control without switching over to position control. The control will be switched over from speed control to position control when the speed-position switching signal turns from OFF to ON again. Only position control will be carried out when the " **Cd.24** Speed-position switching enable flag" and speed-position switching signal are ON at the operation start.)

| Setting item |                                      | Setting value | Setting details                                                                                         | Buffer memory address |        |        |        |
|--------------|--------------------------------------|---------------|---------------------------------------------------------------------------------------------------------|-----------------------|--------|--------|--------|
|              |                                      |               |                                                                                                         | Axis 1                | Axis 2 | Axis 3 | Axis 4 |
| <b>Cd.24</b> | Speed-position switching enable flag | 1             | Set "1: Switch from speed control to position control when the external command signal [CHG] turns ON." | 1528                  | 1628   | 1728   | 1828   |

### ■ Speed-position switching signal setting

The following table shows the items that must be set to use the external command signals (CHG) as speed-position switching signals.

| Setting item       |                                     | Setting value | Setting details                                                    | Buffer memory address |        |        |        |
|--------------------|-------------------------------------|---------------|--------------------------------------------------------------------|-----------------------|--------|--------|--------|
|                    |                                     |               |                                                                    | Axis 1                | Axis 2 | Axis 3 | Axis 4 |
| <span>Pr.42</span> | External command function selection | 2             | Set the "2: speed-position and position-speed switching requests". | 62                    | 212    | 362    | 512    |
| <span>Cd.8</span>  | External command valid              | 1             | Set "1: Validate external command".                                | 1505                  | 1605   | 1705   | 1805   |

\* Refer to Section 5.2 "List of parameters" and Section 5.7 "List of control data" for information on the setting details.

### ■ Operation chart

The following chart (Fig.9.13) shows the operation timing for speed-position switching control (INC mode). The "in speed control flag" ([Md.31] Status: b0) is turned ON during speed control of speed-position switching control (INC mode).

Fig. 9.13 Speed-position switching control (INC mode) operation timing

## [Operation example]

The following operation assumes that the speed-position switching signal is input at the position of the current feed value of 90.00000 [degree] during execution of " [Da.2] Control system "Forward run: speed/position" at " [Pr.1] Unit setting " of "2: degree" and " [Pr.21] Current feed value during speed control" setting of "1: Update current feed value".

(The value set in " [Da.6] Positioning address/movement amount" is 270.00000 [degree])

### ■ Operation timing and processing time during speed-position switching control (INC mode)

Fig. 9.14 Operation timing and processing time during speed-position switching control (INC mode)

#### Normal timing time

| Model           | t1           | t2         | t3         | t4           | t5         | t6    | t7                 |
|-----------------|--------------|------------|------------|--------------|------------|-------|--------------------|
| QD75P□N/QD75D□N | 0.2 to 1.1ms | 0 to 0.9ms | 0 to 0.9ms | 0.4 to 1.3ms | 0 to 0.9ms | 1.0ms | Follows parameters |
| QD75P□/QD75D□   | 1.1ms        | 0 to 1.8ms | 0 to 1.8ms | 2.7 to 4.4ms | 0 to 1.8ms | 1.0ms |                    |

- The t1 timing time could be delayed by the operation state of other axes.

### ■ Current feed value during speed-position switching control (INC mode)

The following table shows the "Md.20 Current feed value" during speed-position switching control (INC mode) corresponding to the "Pr.21 Current feed value during speed control" settings.

| "Pr.21 Current feed value during speed control" setting | Md.20 Current feed value                                                                                                        |
|---------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------|
| 0: Do not update current feed value                     | The current feed value at control start is maintained during speed control, and updated from the switching to position control. |
| 1: Update current feed value                            | The current feed value is updated during speed control and position control.                                                    |
| 2: Zero clear current feed value                        | The current feed value is cleared (set to "0") at control start, and updated from the switching to position control.            |

(a) Current feed value not updated

(b) Current feed value updated

(c) Current feed value zero cleared

### ■ Switching time from speed control to position control

There is 1ms from the time the speed-position switching signal is turned ON to the time the speed-position switching latch flag (Md.31 Status: b1) turns ON.

### ■ Changing the position control movement amount

In "speed-position switching control (INC mode)", the position control movement amount can be changed during the speed control section.

- (1) The "new movement amount" is stored in " **Cd.23** Speed-position switching control movement amount change register" by the sequence program during speed control.

When the speed-position switching signal is turned ON, the movement amount for position control is stored in " **Cd.23** Speed-position switching control movement amount change register".

- (2) The movement amount is stored in the " **Md.29** Speed-position switching control positioning amount" of the axis monitor area from the point where the control changes to position control by the input of a speed-position switching signal from an external source.

Fig. 9.15 Position control movement amount change timing

## POINT

- The machine recognizes the presence of a movement amount change request when the data is written to " [Cd.23] Speed-position switching control movement amount change register" with the sequence program.
- The new movement amount is validated after execution of the speed-position switching control (INC mode), before the input of the speed-position switching signal.
- The movement amount change can be enable/disable with the interlock function in position control using the "speed-position switching latch flag" ([Md.31] Status : b1) of the axis monitor area.

### ■ Restrictions

- (1) The axis error "Continuous path control not possible" (error code: 516) will occur, and the operation cannot start if "continuous path control" is set in " [Da.1] Operation pattern".
- (2) "Speed-position switching control" cannot be set in " [Da.2] Control system" of the positioning data when "continuous path control" has been set in " [Da.1] Operation pattern" of the immediately prior positioning data. (For example, if the operation pattern of positioning data No. 1 is "continuous path control", "speed-position switching control" cannot be set in positioning data No. 2.) The axis error "Continuous path control not possible" (error code: 516) will occur and the machine will carry out a deceleration stop if this type of setting is carried out.
- (3) The error "No command speed" (error code: 503) will occur if "current speed (-1)" is set in " [Da.8] Command speed".
- (4) The software stroke limit range check during speed control is made only when the following (a) and (b) are satisfied:
  - (a) When " [Pr.21] Current feed value during speed control" is "1: Update current feed value"
 

If the movement amount exceeds the software stroke limit range during speed control in cases of settings other than the one above, the error "Software stroke limit+" (error code: 507) or "Software stroke limit-" (error code: 508) will occur as soon as speed control is changed to position control, and the axis will decelerate to a stop.
  - (b) When " [Pr.1] Unit setting" is other than "2: degree"
 

If the unit is "degree", the software stroke limit range check is not performed.
- (5) If the value set in " [Da.6] Positioning address/movement amount" is negative, the error "Outside address range" (error code: 530) will occur.
- (6) Deceleration processing is carried out from the point where the speed-position switching signal is input if the position control movement amount set in " [Da.6] Positioning address/movement amount" is smaller than the deceleration distance from the " [Da.8] Command speed".
- (7) Turn ON the speed-position switching signal in the speed stabilization region (constant speed status). The warning "Speed-position switching (during acceleration) signal ON" (warning code: 508) will occur because of large deviation in the droop pulse amount if the signal is turned ON during acceleration.
 

During use of the servomotor, the actual movement amount after switching of speed control to position control is the "preset movement amount + droop pulse amount". If the signal is turned ON during acceleration/deceleration, the stop position will vary due to large variation of the droop pulse amount. Even though " [Md.29] Speed-position switching control positioning amount" is the same, the stop position will change due to a change in droop pulse amount when " [Da.8] Command speed" is different.

### ■ Positioning data setting examples

The following table shows setting examples when "speed-position switching control (INC mode) by forward run" is set in positioning data No. 1 of axis 1.

| Setting item                     |                                                 | Setting example             | Setting details                                                                                                                                                                                      |
|----------------------------------|-------------------------------------------------|-----------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Axis 1<br>Positioning data No. 1 | <b>Da.1</b> Operation pattern                   | Positioning complete        | Set "Positioning complete" assuming the next positioning data will not be executed. ("Continuous path control" cannot be set in "speed-position switching control (INC mode)".)                      |
|                                  | <b>Da.2</b> Control system                      | Forward run: speed/position | Set speed-position switching control by forward run.                                                                                                                                                 |
|                                  | <b>Da.3</b> Acceleration time No.               | 1                           | Designate the value set in " <b>Pr.25</b> Acceleration time 1" as the acceleration time at start.                                                                                                    |
|                                  | <b>Da.4</b> Deceleration time No.               | 0                           | Designate the value set in " <b>Pr.10</b> Deceleration time 0" as the deceleration time at deceleration.                                                                                             |
|                                  | <b>Da.5</b> Axis to be interpolated             | –                           | Setting not required. (Setting value is ignored.)                                                                                                                                                    |
|                                  | <b>Da.6</b> Positioning address/movement amount | 10000.0μm                   | INC mode ( <b>Pr.150</b> = 0)<br>Set the movement amount after the switching to position control. (Assuming that the " <b>Pr.1</b> Unit setting" is set to "mm".)                                    |
|                                  | <b>Da.7</b> Arc address                         | –                           | Setting not required. (Setting value is ignored.)                                                                                                                                                    |
|                                  | <b>Da.8</b> Command speed                       | 6000.00mm/min               | Set the speed to be controlled.                                                                                                                                                                      |
|                                  | <b>Da.9</b> Dwell time                          | 500ms                       | Set a time from the positioning stop (pulse output stop) by position control until the positioning complete signal is output. When the system is stopped by speed control, ignore the setting value. |
|                                  | <b>Da.10</b> M code                             | 10                          | Set this when other sub operation commands are issued in combination with the No. 1 positioning data.                                                                                                |

\* Refer to Section 5.3 "List of positioning data" for information on the setting details.

## 9.2.19 Speed-position switching control (ABS mode)

In case of "speed-position switching control (ABS mode)" (" **Da.2** Control system" = Forward run: speed/position, Reverse run: speed/position), the pulses of the speed set in " **Da.8** Command speed" are kept output in the axial direction set to the positioning data. When the "speed-position switching signal" is input, position control to the address set in " **Da.6** Positioning address/movement amount" is exercised.

"Speed-position switching control (ABS mode)" is available in two different types: "forward run: speed/position" which starts the axis in the forward run direction and "reverse run: speed/position" which starts the axis in the reverse run direction.

"Speed-position switching control (ABS mode)" is valid only when " **Pr.1** Unit setting" is "2: degree".

| <b>Pr.1</b> Unit setting          | mm | inch | degree | pulse |
|-----------------------------------|----|------|--------|-------|
| Speed-position function selection |    |      |        |       |
| INC mode                          | ○  | ○    | ○      | ○     |
| ABS mode                          | ×  | ×    | ○      | ×     |

○: Setting allowed,

×: Setting disallowed (If setting is made, the error "Speed-position function selection error" (error code: 935) will occur when the PLC READY (Y0) turns ON.)

Use the detailed parameter 1 " **Pr.150** Speed-position function selection" to choose "speed-position switching control (ABS mode)".

| Setting item  |                                   | Setting value | Setting details                             | Buffer memory address |        |        |        |
|---------------|-----------------------------------|---------------|---------------------------------------------|-----------------------|--------|--------|--------|
|               |                                   |               |                                             | Axis 1                | Axis 2 | Axis 3 | Axis 4 |
| <b>Pr.150</b> | Speed-position function selection | 2             | Speed-position switching control (ABS mode) | 34                    | 184    | 334    | 484    |

\* If the set value is other than 0 and 2, it is regarded as 0 and operation is performed in the INC mode.

For details of the setting, refer to Section 5.2 "List of parameters".

### ■ Switching over from speed control to position control

- (1) The control is switched over from speed control to position control by executing the external command signal set in "speed-position switching signal".
- (2) Besides setting the positioning data, the " Cd.24 Speed-position switching enable flag" must also be turned ON to switch over from speed control to position control. (If the " Cd.24 Speed-position switching enable flag" turns ON after the speed-position switching signal turns ON, the control will continue as speed control without switching over to position control. The control will be switched over from speed control to position control when the speed-position switching signal turns from OFF to ON again. Only position control will be carried out when the " Cd.24 Speed-position switching enable flag" and speed-position switching signal are ON at the operation start.)

| Setting item                                                        |                                      | Setting value | Setting details                                                                                         | Buffer memory address |        |        |        |
|---------------------------------------------------------------------|--------------------------------------|---------------|---------------------------------------------------------------------------------------------------------|-----------------------|--------|--------|--------|
|                                                                     |                                      |               |                                                                                                         | Axis 1                | Axis 2 | Axis 3 | Axis 4 |
| <span style="border: 1px solid black; padding: 0 2px;">Cd.24</span> | Speed-position switching enable flag | 1             | Set "1: Switch from speed control to position control when the external command signal [CHG] turns ON." | 1528                  | 1628   | 1728   | 1828   |

### ■ Speed-position switching signal setting

The following table shows the items that must be set to use the external command signals (CHG) as speed-position switching signals.

| Setting item                                                        |                                     | Setting value | Setting details                                                    | Buffer memory address |        |        |        |
|---------------------------------------------------------------------|-------------------------------------|---------------|--------------------------------------------------------------------|-----------------------|--------|--------|--------|
|                                                                     |                                     |               |                                                                    | Axis 1                | Axis 2 | Axis 3 | Axis 4 |
| <span style="border: 1px solid black; padding: 0 2px;">Pr.42</span> | External command function selection | 2             | Set the "2: speed-position and position-speed switching requests". | 62                    | 212    | 362    | 512    |
| <span style="border: 1px solid black; padding: 0 2px;">Cd.8</span>  | External command valid              | 1             | Set "1: Validate external command".                                | 1505                  | 1605   | 1705   | 1805   |

\* Refer to Section 5.2 "List of parameters" and Section 5.7 "List of control data" for information on the setting details.

### ■ Operation chart

The following chart (Fig.9.16) shows the operation timing for speed-position switching control (ABS mode). The "in speed control flag" (Md.31 Status: b0) is turned ON during speed control of speed-position switching control (ABS mode).

Fig. 9.16 Speed-position switching control (ABS mode) operation timing

## [Operation example]

The following operation assumes that the speed-position switching signal is input at the position of the current feed value of 90.00000 [degree] during execution of " [Da.2] Control system" "Forward run: speed/position" at " [Pr.1] Unit setting" of "2: degree" and " [Pr.21] Current feed value during speed control" setting of "1: Update current feed value".

(The value set in " [Da.6] Positioning address/movement amount" is 270.00000 [degree])

■ Operation timing and processing time during speed-position switching control (ABS mode)

Fig. 9.17 Operation timing and processing time during speed-position switching control (ABS mode)

Normal timing time

| Model           | t1           | t2         | t3         | t4           | t5         | t6    | t7                 |
|-----------------|--------------|------------|------------|--------------|------------|-------|--------------------|
| QD75P□N/QD75D□N | 0.2 to 1.1ms | 0 to 0.9ms | 0 to 0.9ms | 0.4 to 1.3ms | 0 to 0.9ms | 1.0ms | Follows parameters |
| QD75P□/QD75D□   | 1.1ms        | 0 to 1.8ms | 0 to 1.8ms | 2.7 to 4.4ms | 0 to 1.8ms | 1.0ms |                    |

- The t1 timing time could be delayed by the operation state of other axes.

### ■ Current feed value during speed-position switching control (ABS mode)

The following table shows the " [Md.20] Current feed value" during speed-position switching control (ABS mode) corresponding to the " [Pr.21] Current feed value during speed control" settings.

| " [Pr.21] Current feed value during speed control" setting | [Md.20] Current feed value                                                   |
|------------------------------------------------------------|------------------------------------------------------------------------------|
| 1: Update current feed value                               | The current feed value is updated during speed control and position control. |

Only "1: Update current value" is valid for the setting of " [Pr.21] Current feed value during speed control" in speed-position switching control (ABS mode). The error "Speed-position function selection error" (error code: 935) will occur if the " [Pr.21] Current feed value during speed control" setting is other than 1.

Current feed value updated

### ■ Switching time from speed control to position control

There is 1ms from the time the speed-position switching signal is turned ON to the time the speed-position switching latch flag ([Md.31] Status: b1) turns ON.

### ■ Restrictions

- (1) The axis error "Continuous path control not possible" (error code: 516) will occur, and the operation cannot start if "continuous path control" is set in " [Da.1] Operation pattern".
- (2) "Speed-position switching control" cannot be set in " [Da.2] Control system" of the positioning data when "continuous path control" has been set in " [Da.1] Operation pattern" of the immediately prior positioning data. (For example, if the operation pattern of positioning data No. 1 is "continuous path control", "speed-position switching control" cannot be set in positioning data No. 2.) The axis error "Continuous path control not possible" (error code: 516) will occur and the machine will carry out a deceleration stop if this type of setting is carried out.
- (3) The error "No command speed" (error code: 503) will occur if "current speed (-1)" is set in " [Da.8] Command speed".
- (4) If the value set in " [Da.6] Positioning address/movement amount" is negative, the error "Outside address range" (error code: 530) will occur.
- (5) Even though the axis control data " [Cd.23] Speed-position switching control movement amount change register" was set in speed-position switching control (ABS mode), it would not function. The set value is ignored.
- (6) To exercise speed-position switching control (ABS mode), the following conditions must be satisfied:
  - (a) " [Pr.1] Unit setting" is "2: degree"
  - (b) The software stroke limit function is invalid (upper limit value = lower limit value)
  - (c) " [Pr.21] Current feed value during speed control" is "1: Update current feed value"
  - (d) The setting range of " [Da.6] Positioning address/movement amount" is within 0 to 359.99999 (degree)  
(If the value is outside of the range, the error "Outside address range" (error code: 530) will occur at the start.)
  - (e) The " [Pr.150] Speed-position function selection" setting is "2: Speed-position switching control (ABS mode)".
- (7) If any of the conditions in (6)(a) to (6)(c) is not satisfied in the case of (6)(e), the error "Speed-position function selection error" (error code: 935) will occur when the PLC READY [Y0] turns from OFF to ON.
- (8) If the axis reaches the positioning address midway through deceleration after automatic deceleration started at the input of the speed-position switching signal, the axis will not stop immediately at the positioning address. The axis will stop at the positioning address after N revolutions so that automatic deceleration can always be made. (N: Natural number)  
In the following example, since making deceleration in the path of dotted line will cause the axis to exceed the positioning addresses twice, the axis will decelerate to a stop at the third positioning address.

### ■ Positioning data setting examples

The following table shows setting examples when "speed-position switching control (ABS mode) by forward run" is set in positioning data No. 1 of axis 1.

| Setting item                     |                                                 | Setting example             | Setting details                                                                                                                                                                                      |
|----------------------------------|-------------------------------------------------|-----------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Axis 1<br>Positioning data No. 1 | <b>Da.1</b> Operation pattern                   | Positioning complete        | Set "Positioning complete" assuming the next positioning data will not be executed. ("Continuous path control" cannot be set in "speed-position switching control (ABS mode)".)                      |
|                                  | <b>Da.2</b> Control system                      | Forward run: speed/position | Set speed-position switching control by forward run.                                                                                                                                                 |
|                                  | <b>Da.3</b> Acceleration time No.               | 1                           | Designate the value set in " <b>Pr.25</b> Acceleration time 1" as the acceleration time at start.                                                                                                    |
|                                  | <b>Da.4</b> Deceleration time No.               | 0                           | Designate the value set in " <b>Pr.10</b> Deceleration time 0" as the deceleration time at deceleration.                                                                                             |
|                                  | <b>Da.5</b> Axis to be interpolated             | –                           | Setting not required. (Setting value is ignored.)                                                                                                                                                    |
|                                  | <b>Da.6</b> Positioning address/movement amount | 270.00000 degree            | ABS mode ( <b>Pr.150</b> = 2)<br>Set the address after the switching to position control. (Assuming that the " <b>Pr.1</b> Unit setting" is set to "degree".)                                        |
|                                  | <b>Da.7</b> Arc address                         | –                           | Setting not required. (Setting value is ignored.)                                                                                                                                                    |
|                                  | <b>Da.8</b> Command speed                       | 6000.00mm/min               | Set the speed to be controlled.                                                                                                                                                                      |
|                                  | <b>Da.9</b> Dwell time                          | 500ms                       | Set a time from the positioning stop (pulse output stop) by position control until the positioning complete signal is output. When the system is stopped by speed control, ignore the setting value. |
|                                  | <b>Da.10</b> M code                             | 10                          | Set this when other sub operation commands are issued in combination with the No. 1 positioning data.                                                                                                |

\* Refer to Section 5.3 "List of positioning data" for information on the setting details.

## 9.2.20 Position-speed switching control

In "position-speed switching control" (" [Da.2] Control system" = Forward run: position/speed, Reverse run: position/speed), before the position-speed switching signal is input, position control is carried out for the movement amount set in " [Da.6] Positioning address/movement amount" in the axis direction in which the positioning data has been set. When the position-speed switching signal is input, the position control is carried out by continuously outputting the pulses for the speed set in " [Da.8] Command speed" until the input of a stop command.

The two types of position-speed switching control are "Forward run: position/speed" in which the control starts in the forward run direction, and "Reverse run: position/speed" in which control starts in the reverse run direction.

#### ■ Switching over from position control to speed control

- (1) The control is switched over from position control to speed control by executing the external command signal set in "position-speed switching signal".
- (2) Besides setting the positioning data, the " [Cd.26] Position-speed switching enable flag" must also be turned ON to switch over from position control to speed control. (If the " [Cd.26] Position-speed switching enable flag" turns ON after the position-speed switching signal turns ON, the control will continue as position control without switching over to speed control. The control will be switched over from position control to speed control when the position-speed switching signal turns from OFF to ON again. Only speed control will be carried out when the " [Cd.26] Position-speed switching enable flag" and position-speed switching signal are ON at the operation start.)

| Setting item |                                      | Setting value | Setting details                                                                                         | Buffer memory address |        |        |        |
|--------------|--------------------------------------|---------------|---------------------------------------------------------------------------------------------------------|-----------------------|--------|--------|--------|
|              |                                      |               |                                                                                                         | Axis 1                | Axis 2 | Axis 3 | Axis 4 |
| [Cd.26]      | Position-speed switching enable flag | 1             | Set "1: Switch from position control to speed control when the external command signal [CHG] turns ON". | 1532                  | 1632   | 1732   | 1832   |

#### ■ Position-speed switching signal setting

The following table shows the items that must be set to use the external command signals (CHG) as position-speed switching signals.

| Setting item |                                     | Setting value | Setting details                                                    | Buffer memory address |        |        |        |
|--------------|-------------------------------------|---------------|--------------------------------------------------------------------|-----------------------|--------|--------|--------|
|              |                                     |               |                                                                    | Axis 1                | Axis 2 | Axis 3 | Axis 4 |
| [Pr.42]      | External command function selection | 2             | Set the "2: speed-position and position-speed switching requests". | 62                    | 212    | 362    | 512    |
| [Cd.8]       | External command valid              | 1             | Set "1: Validate external command".                                | 1505                  | 1605   | 1705   | 1805   |

\* Refer to Section 5.2 "List of parameters" and Section 5.7 "List of control data" for information on the setting details.

### ■ Operation chart

The following chart shows the operation timing for position-speed switching control.

The "in speed control" flag (**[Md.31]** Status: b0) is turned ON during speed control of position-speed switching control.

Fig. 9.18 Position-speed switching control operation timing

### ■ Operation timing and processing time during position-speed switching control

Fig. 9.19 Operation timing and processing time during position-speed switching control

#### Normal timing time

| Model           | t1           | t2         | t3         | t4           | t5 | t6    |
|-----------------|--------------|------------|------------|--------------|----|-------|
| QD75P□N/QD75D□N | 0.2 to 1.1ms | 0 to 0.9ms | 0 to 0.9ms | 0.4 to 1.3ms | -  | 1.0ms |
| QD75P□/QD75D□   | 1.0 to 1.4ms | 0 to 1.8ms | 0 to 1.8ms | 2.7 to 4.4ms | -  | 1.0ms |

- The t1 timing time could be delayed by the operation state of other axes.

### ■ Current feed value during position-speed switching control

The following table shows the " [Md.20] Current feed value" during position-speed switching control corresponding to the " [Pr.21] Current feed value during speed control" settings.

| " [Pr.21] Current feed value during speed control" setting | [Md.20] Current feed value                                                                                                                                                             |
|------------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 0: Do not update current feed value                        | The current feed value is updated during position control, and the current feed value at the time of switching is maintained as soon as position control is switched to speed control. |
| 1: Update current feed value                               | The current feed value is updated during position control and speed control.                                                                                                           |
| 2: Zero clear current feed value                           | The current feed value is updated during positioning control, and the current feed value is cleared (to "0") as soon as position control is switched to speed control.                 |

(a) Current feed value not updated

(b) Current feed value updated

(c) Current feed value zero cleared

### ■ Switching time from position control to speed control

There is 1ms from the time the position-speed switching signal is turned ON to the time the position-speed switching latch flag ([Md.31] Status: b5) turns ON.

### ■ Changing the speed control command speed

In "position-speed switching control", the speed control command speed can be changed during the position control.

- (1) The speed control command speed can be changed during the position control of position-speed switching control.

A command speed change request will be ignored unless issued during the position control of the position-speed switching control.

- (2) The "new command speed" is stored in " Cd.25 Position-speed switching control speed change register" by the sequence program during position control.

This value then becomes the speed control command speed when the position-speed switching signal turns ON.

Fig. 9.20 Speed control speed change timing

**POINTS**

- The machine recognizes the presence of a command speed change request when the data is written to " [Cd.25] Position-speed switching control speed change register" with the sequence program.
- The new command speed is validated after execution of the position-speed switching control before the input of the position-speed switching signal.
- The command speed change can be enabled/disabled with the interlock function in speed control using the "position-speed switching latch flag" ([Md.31] Status: b5) of the axis monitor area.

**■ Restrictions**

- (1) The axis error "Continuous path control not possible" (error code: 516) will occur and the operation cannot start if "continuous positioning control" or "continuous path control" is set in " [Da.1] Operation pattern".
- (2) "Position-speed switching control" cannot be set in " [Da.2] Control system" of the positioning data when "continuous path control" has been set in " [Da.1] Operation pattern" of the immediately prior positioning data. (For example, if the operation pattern of positioning data No. 1 is "continuous path control", "position-speed switching control" cannot be set in positioning data No. 2.) The axis error "Continuous path control not possible" (error code: 516) will occur and the machine will carry out a deceleration stop if this type of setting is carried out.
- (3) The software stroke limit range is only checked during speed control if the "1: Update current feed value" is set in " [Pr.21] Current feed value during speed control".  
The software stroke limit range is not checked when the control unit is set to "degree".
- (4) The error "Software stroke limit+" or "Software stroke limit-" (error code: 507 or 508) will occur and the operation cannot start if the start point address or end point address for position control exceeds the software stroke limit range.
- (5) Deceleration stop will be carried out if the position-speed switching signal is not input before the machine is moved by a specified movement amount.  
When the position-speed switching signal is input during automatic deceleration by positioning control, acceleration is carried out again to the command speed to continue speed control.  
When the position-speed switching signal is input during deceleration to a stop with the stop signal, the control is switched to the speed control to stop the machine.  
Restart is carried out by speed control using the restart command.
- (6) The warning "Speed limit value over" (warning code: 501) will occur and control is continued by " [Pr.8] Speed limit value" if a new speed exceeds " [Pr.8] Speed limit value" at the time of change of the command speed.
- (7) If the value set in " [Da.6] Positioning address/movement amount" is negative, the error "Outside address range" (error code: 530) will occur.

### ■ Positioning data setting examples

The following table shows setting examples when "position-speed switching control (forward run: position/speed)" is set in positioning data No. 1 of axis 1.

| Setting item                     |              | Setting example                     | Setting details             |
|----------------------------------|--------------|-------------------------------------|-----------------------------|
| Axis 1<br>Positioning data No. 1 | <b>Da.1</b>  | Operation pattern                   | Positioning complete        |
|                                  | <b>Da.2</b>  | Control system                      | Forward run: position/speed |
|                                  | <b>Da.3</b>  | Acceleration time No.               | 1                           |
|                                  | <b>Da.4</b>  | Deceleration time No.               | 0                           |
|                                  | <b>Da.5</b>  | Axis to be interpolated             | –                           |
|                                  | <b>Da.6</b>  | Positioning address/movement amount | 10000.0μm                   |
|                                  | <b>Da.7</b>  | Arc address                         | –                           |
|                                  | <b>Da.8</b>  | Command speed                       | 6000.00mm/min               |
|                                  | <b>Da.9</b>  | Dwell time                          | 500ms                       |
|                                  | <b>Da.10</b> | M code                              | 10                          |

\* Refer to Section 5.3 "List of positioning data" for information on the setting details.

## 9.2.21 Current value changing

When the current value is changed to a new value, control is carried out in which the " [Md.20] Current feed value" of the stopped axis is changed to a random address set by the user. (The " [Md.21] Machine feed value" is not changed when the current value is changed.)

The two methods for changing the current value are shown below.

- [1] Changing to a new current value using the positioning data
- [2] Changing to a new current value using the start No. (No. 9003) for a current value changing

The current value changing using method [1] is used during continuous positioning of multiple blocks, etc.

## [1] Changing to a new current value using the positioning data

## ■ Operation chart

The following chart shows the operation timing for a current value changing. The " [Md.20] Current feed value" is changed to the value set in " [Da.6] Positioning address/movement amount" when the positioning start signal turns ON.

## ■ Restrictions

- (1) An axis error "New current value not possible" (error code: 515) will occur and the operation cannot start if "continuous path control" is set in " [Da.1] Operation pattern". ("Continuous path control" cannot be set in current value changing.)
- (2) "Current value changing" cannot be set in " [Da.2] Control system" of the positioning data when "continuous path control" has been set in " [Da.1] Operation pattern" of the immediately prior positioning data. (For example, if the operation pattern of positioning data No. 1 is "continuous path control", "current value changing" cannot be set in positioning data No. 2.) An axis error "New current value not possible" (error code: 515) will occur and the machine will carry out a deceleration stop if this type of setting is carried out.
- (3) An axis error "Outside new current value range" (error code: 514) will occur and the operation cannot start if "degree" is set in " [Pr.1] Unit setting" and the value set in " [Da.6] Positioning address/movement amount" is outside the setting range (0 to 359.99999 [degree]).

- (4) If the value set in " **Da.6** Positioning address/movement amount" is outside the software stroke limit ( **Pr.12**, **Pr.13** ) setting range, an error "Software stroke limit +" or "Software stroke limit –" (error code: 507 or 508) will occur at the positioning start, and the operation will not start.

#### ■ Positioning data setting examples

The following table shows the setting examples when " current value changing" is set in the positioning data No. 1 of axis 1.

| Setting item                        |              |                                               | Setting example        | Setting details                                                                                                                                         |
|-------------------------------------|--------------|-----------------------------------------------|------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------|
| Axis 1<br>positioning<br>data No. 1 | <b>Da.1</b>  | Operation<br>pattern                          | Positioning complete   | Set "Positioning complete" assuming that the next positioning data will be executed. ("Continuous path control" cannot be set by current value change.) |
|                                     | <b>Da.2</b>  | Control<br>system                             | Current value changing | Set the current value changing.                                                                                                                         |
|                                     | <b>Da.3</b>  | Acceleration<br>time No.                      | –                      | Setting not required (Setting value is ignored.)                                                                                                        |
|                                     | <b>Da.4</b>  | Deceleration<br>time No.                      | –                      | Setting not required (Setting value is ignored.)                                                                                                        |
|                                     | <b>Da.5</b>  | Axis to be<br>interpolated                    | –                      | Setting not required (Setting value is ignored.)                                                                                                        |
|                                     | <b>Da.6</b>  | Positioning<br>address/<br>movement<br>amount | 10000.0 $\mu$ m        | Set the address to which address change is desired. (Assuming that the " <b>Pr.1</b> Unit setting" is set to "mm".)                                     |
|                                     | <b>Da.7</b>  | Arc address                                   | –                      | Setting not required (Setting value is ignored.)                                                                                                        |
|                                     | <b>Da.8</b>  | Command<br>speed                              | –                      | Setting not required (Setting value is ignored.)                                                                                                        |
|                                     | <b>Da.9</b>  | Dwell time                                    | –                      | Setting not required (Setting value is ignored.)                                                                                                        |
|                                     | <b>Da.10</b> | M code                                        | 10                     | Set this when other sub operation commands are issued in combination with the No. 1 positioning data.                                                   |

\* Refer to Section 5.3 "List of positioning data" for information on the setting details.

## [2] Changing to a new current value using the start No. (No. 9003) for a current value changing

### ■ Operation chart

The current value is changed by setting the new current value in the current value changing buffer memory " [Cd.9] Current value changing", setting "9003" in the " [Cd.3] Positioning start No.", and turning ON the positioning start signal.

### ■ Restrictions

- (1) An axis error "Outside new current value range" (error code: 514) will occur if the designated value is outside the setting range when "degree" is set in "Unit setting".
- (2) An error "Software stroke limit +" or "Software stroke limit -" (error code: 507 or 508) will occur if the designated value is outside the software stroke limit range.
- (3) The current value cannot be changed during stop commands and while the M code ON signal is ON.
- (4) The M code output function is made invalid.

### ■ Current value changing procedure

The following shows the procedure for changing the current value to a new value.

### ■ Setting method for the current value changing function

The following shows an example of a sequence program and data setting to change the current value to a new value with the positioning start signal. (The " **Md.20** " Current feed value is changed to "5000.0μm" in the example shown.)

(1) Set the following data.

(Set with the sequence program shown in (3), while referring to the start time chart shown in (2).)

| Setting item                       | Setting value | Setting details                                     | Buffer memory address |              |              |              |
|------------------------------------|---------------|-----------------------------------------------------|-----------------------|--------------|--------------|--------------|
|                                    |               |                                                     | Axis 1                | Axis 2       | Axis 3       | Axis 4       |
| <b>Cd.3</b> Positioning start No.  | 9003          | Set the start No. "9003" for the new current value. | 1500                  | 1600         | 1700         | 1800         |
| <b>Cd.9</b> Current value changing | 50000         | Set the new " <b>Md.20</b> " Current feed value".   | 1506<br>1507          | 1606<br>1607 | 1706<br>1707 | 1806<br>1807 |

\* Refer to Section 5.7 "List of control data" for details on the setting details.

(2) The following shows a start time chart.

Fig. 9.21 Changing to a new current value using the start No. (No. 9003) for a current value changing

(3) Add the following sequence program to the control program, and write it to the CPU module.

## 9.2.22 NOP instruction

The NOP instruction is used for the nonexecutable control system.

### ■ Operation

The positioning data No. to which the NOP instruction is set transfers, without any processing, to the operation for the next positioning data No.

### ■ Positioning data setting examples

The following table shows the setting examples when "NOP instruction" is set in positioning data No. 1 of axis 1.

| Setting item                        |                                                       | Setting example | Setting details                                  |
|-------------------------------------|-------------------------------------------------------|-----------------|--------------------------------------------------|
| Axis 1<br>positioning<br>data No. 1 | Da.1<br>Operation<br>pattern                          | —               | Setting not required (Setting value is ignored.) |
|                                     | Da.2<br>Control<br>system                             | NOP instruction | Set the NOP instruction                          |
|                                     | Da.3<br>Acceleration<br>time No.                      | —               | Setting not required (Setting value is ignored.) |
|                                     | Da.4<br>Deceleration<br>time No.                      | —               | Setting not required (Setting value is ignored.) |
|                                     | Da.5<br>Axis to be<br>interpolated                    | —               | Setting not required (Setting value is ignored.) |
|                                     | Da.6<br>Positioning<br>address/<br>movement<br>amount | —               | Setting not required (Setting value is ignored.) |
|                                     | Da.7<br>Arc address                                   | —               | Setting not required (Setting value is ignored.) |
|                                     | Da.8<br>Command<br>speed                              | —               | Setting not required (Setting value is ignored.) |
|                                     | Da.9<br>Dwell time                                    | —               | Setting not required (Setting value is ignored.) |
|                                     | Da.10<br>M code                                       | —               | Setting not required (Setting value is ignored.) |

\* Refer to Section 5.3 "List of positioning data" for information on the setting details.

### ■ Restrictions

An error "Control system setting error" (error code: 524) will occur if the "NOP instruction" is set for the control system of the positioning data No. 600.

| POINT                                                                                                                                                                                                                                                                                                             |
|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <p>&lt;Use example of NOP instruction&gt;</p> <p>If there is a possibility of speed switching or temporary stop (automatic deceleration) at a point between two points during positioning, that data can be reserved with the NOP instruction to change the data merely by the replacement of the identifier.</p> |

### 9.2.23 JUMP instruction

The JUMP instruction is used to control the operation so it jumps to a positioning data No. set in the positioning data during "continuous positioning control" or "continuous path control".

JUMP instruction include the following two types of JUMP.

- (1) Unconditional JUMP  
When no execution conditions are set for the JUMP instruction  
(When "0" is set as the condition data No.)
- (2) Conditional JUMP  
When execution conditions are set for the JUMP instruction  
(The conditions are set in the "condition data" used with "high-level positioning control".)

Using the JUMP instruction enables repeating of the same positioning control, or selection of positioning data by the execution conditions during "continuous positioning control" or "continuous path control".

#### ■ Operation

- (1) Unconditional JUMP  
The JUMP instruction is unconditionally executed. The operation jumps to the positioning data No. set in " **Da.9** Dwell time".
- (2) Conditional JUMP  
The block start condition data is used as the JUMP instruction execution conditions.
  - When block positioning data No. 7000 to 7004 is started:  
Each block condition data is used.
  - When positioning data No. 1 to 600 is started:  
Start block 0 condition data is used.
  - When the execution conditions set in " **Da.10** M code" of the JUMP instruction have been established:  
the JUMP instruction is executed to jump the operation to the positioning data No. set in " **Da.9** Dwell time".
  - When the execution conditions set in " **Da.10** M code" of the JUMP instruction have not been established:  
the JUMP instruction is ignored, and the next positioning data No. is executed.

#### ■ Restrictions

- (1) When using a conditional JUMP instruction, establish the JUMP instruction execution conditions by the 4th positioning data No. before the JUMP instruction positioning data No.  
If the JUMP instruction execution conditions are not established by the time the 4th positioning control is carried out before the JUMP instruction positioning data No., the operation will be processed as an operation without established JUMP instruction execution conditions.  
(During execution of continuous path control/continuous positioning control, the QD75 calculates the positioning data of the positioning data No. four items ahead of the current positioning data.)

- (2) Positioning control such as loops cannot be executed by conditional JUMP instructions alone until the conditions have been established.  
As the target of the JUMP instruction, specify a positioning data that is controlled by other than JUMP and NOP instructions.

#### ■ Positioning data setting example

The following table shows setting examples when "JUMP instruction" is set in positioning data No. 1 of axis 1.

| Setting item                     |                  | Setting example                     | Setting details  |                                                                                                                                                                                                                                      |
|----------------------------------|------------------|-------------------------------------|------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Axis 1<br>Positioning data No. 1 | <div>Da.1</div>  | Operation pattern                   | —                | Setting not required. (Setting value is ignored.)                                                                                                                                                                                    |
|                                  | <div>Da.2</div>  | Control system                      | JUMP instruction | Set the JUMP instruction.                                                                                                                                                                                                            |
|                                  | <div>Da.3</div>  | Acceleration time No.               | —                | Setting not required. (Setting value is ignored.)                                                                                                                                                                                    |
|                                  | <div>Da.4</div>  | Deceleration time No.               | —                | Setting not required. (Setting value is ignored.)                                                                                                                                                                                    |
|                                  | <div>Da.5</div>  | Axis to be interpolated             | —                | Setting not required. (Setting value is ignored.)                                                                                                                                                                                    |
|                                  | <div>Da.6</div>  | Positioning address/movement amount | —                | Setting not required. (Setting value is ignored.)                                                                                                                                                                                    |
|                                  | <div>Da.7</div>  | Arc address                         | —                | Setting not required. (Setting value is ignored.)                                                                                                                                                                                    |
|                                  | <div>Da.8</div>  | Command speed                       | —                | Setting not required. (Setting value is ignored.)                                                                                                                                                                                    |
|                                  | <div>Da.9</div>  | Dwell time                          | 500              | Set the positioning data No. 1 to 600 for the JUMP destination. (The positioning data No. of the JUMP instruction cannot be set. Setting its own positioning data No. will result in an error "Illegal data No." (error code: 502).) |
|                                  | <div>Da.10</div> | M code                              | 1                | Set the JUMP instruction execution conditions with the condition data No.<br>0 : Unconditional JUMP<br>1 to 10 : Condition data No.<br>("Simultaneous start" condition data cannot be set.)                                          |

\* Refer to Section 5.3 "List of positioning data" for information on the setting details.

## 9.2.24 LOOP

The LOOP is used for loop control by the repetition of LOOP to LEND.

### ■ Operation

The LOOP to LEND loop is repeated by set repeat cycles.

### ■ Positioning data setting examples

The following table shows the setting examples when "LOOP" is set in positioning data No. 1 of axis 1.

| Setting item                     |       | Setting example                     | Setting details |                                                   |
|----------------------------------|-------|-------------------------------------|-----------------|---------------------------------------------------|
| Axis 1<br>Positioning data No. 1 | Da.1  | Operation pattern                   | –               | Setting not required. (Setting value is ignored.) |
|                                  | Da.2  | Control system                      | LOOP            | Set the LOOP.                                     |
|                                  | Da.3  | Acceleration time No.               | –               | Setting not required. (Setting value is ignored.) |
|                                  | Da.4  | Deceleration time No.               | –               | Setting not required. (Setting value is ignored.) |
|                                  | Da.5  | Axis to be interpolated             | –               | Setting not required. (Setting value is ignored.) |
|                                  | Da.6  | Positioning address/movement amount | –               | Setting not required. (Setting value is ignored.) |
|                                  | Da.7  | Arc address                         | –               | Setting not required. (Setting value is ignored.) |
|                                  | Da.8  | Command speed                       | –               | Setting not required. (Setting value is ignored.) |
|                                  | Da.9  | Dwell time                          | –               | Setting not required. (Setting value is ignored.) |
|                                  | Da.10 | M code                              | 5               | Set the LOOP to LEND repeat cycles.               |

\* Refer to Section 5.3 "List of positioning data" for information on the setting details.

### ■ Restrictions

- (1) An error "Control system LOOP setting error" (error code: 545) will occur if a "0" is set for the repeat cycles.
- (2) Even if LEND is absent after LOOP, no error will occur, but repeat processing will not be carried out.
- (3) Nesting is not allowed between LOOP-LEND's. If such setting is made, only the inner LOOP-LEND is processed repeatedly.

| POINT                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <p>The setting by this control system is easier than that by the special start "FOR loop" of "High-level Positioning Control" (refer to CHAPTER 10).</p> <p>&lt;Setting data&gt;</p> <ul style="list-style-type: none"> <li>• For special start: Positioning start data, special start data, condition data, and positioning data</li> <li>• For control system: Positioning data</li> </ul> <p>For the special start FOR to NEXT, the positioning data is required for each of FOR and NEXT points. For the control system, loop can be executed even only by one data.</p> <p>Also, nesting is enabled by using the control system LOOP to LEND in combination with the special start FOR to NEXT.</p> <p>However LOOP to LEND cannot be set across block. Always set LOOP to LEND so that the processing ends within one block.</p> <p>(For details of the "block", refer to Section 10.1 "Outline of high-level positioning control".)</p> |

## 9.2.25 LEND

The LEND is used to return the operation to the top of the repeat (LOOP to LEND) loop.

### ■ Operation

When the repeat cycle designated by the LOOP becomes 0, the loop is terminated, and the next positioning data No. processing is started. (The operation pattern, if set to "Positioning complete", will be ignored.)

When the operation is stopped after the repeat operation is executed by designated cycles, the dummy positioning data (for example, incremental positioning without movement amount) is set next to LEND.

| Positioning data No. | Operation pattern       | Control system | Conditions               | Operation                                                                                                                                                              |
|----------------------|-------------------------|----------------|--------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 1                    | Continuous control      | ABS2           |                          | Executed in the order of the positioning data No. 1 → 2 → 3 → 4 → 5 → 2 → 3 → 4 → 5 → 6.<br>(The operation patterns of the positioning data Nos. 2 and 5 are ignored.) |
| 2                    | Positioning complete    | LOOP           | Number of loop cycles: 2 |                                                                                                                                                                        |

| 6                    | Positioning complete    | ABS2           |                          |                                                                                                                                                                        |

### ■ Positioning data setting examples

The following table shows the setting examples when "LEND" is set in positioning data No. 8 of axis 1.

| Setting item                     |                                          | Setting example | Setting details                                   |
|----------------------------------|------------------------------------------|-----------------|---------------------------------------------------|
| Axis 1<br>Positioning data No. 8 | Da.1 Operation pattern                   | –               | Setting not required. (Setting value is ignored.) |
|                                  | Da.2 Control system                      | LEND            | Set the LEND.                                     |
|                                  | Da.3 Acceleration time No.               | –               | Setting not required. (Setting value is ignored.) |
|                                  | Da.4 Deceleration time No.               | –               | Setting not required. (Setting value is ignored.) |
|                                  | Da.5 Axis to be interpolated             | –               | Setting not required. (Setting value is ignored.) |
|                                  | Da.6 Positioning address/movement amount | –               | Setting not required. (Setting value is ignored.) |
|                                  | Da.7 Arc address                         | –               | Setting not required. (Setting value is ignored.) |
|                                  | Da.8 Command speed                       | –               | Setting not required. (Setting value is ignored.) |
|                                  | Da.9 Dwell time                          | –               | Setting not required. (Setting value is ignored.) |
|                                  | Da.10 M code                             | –               | Setting not required. (Setting value is ignored.) |

\* Refer to Section 5.3 "List of positioning data" for information on the setting details.

### ■ Restrictions

(1) Ignore the "LEND" before the "LOOP" is executed.

# MEMO

[illegible]

# CHAPTER 10 HIGH-LEVEL POSITIONING CONTROL

The details and usage of high-level positioning control (control functions using the "block start data") are explained in this chapter.

High-level positioning control is used to carry out applied control using the "positioning data". Examples of applied control are using conditional judgment to control "positioning data" set with the major positioning control, or simultaneously starting "positioning data" for several different axes.

Read the execution procedures and settings for each control, and set as required.

## 10.1 Outline of high-level positioning control

In "high-level positioning control" the execution order and execution conditions of the "positioning data" are set to carry out more applied positioning. (The execution order and execution conditions are set in the "block start data" and "condition data".)  
The following applied positioning controls can be carried out with "high-level positioning control".

| High-level positioning control   | Details                                                                                                                                                                                                                                                                                                                                   |
|----------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Block *1 start<br>(Normal start) | With one start, executes the positioning data in a random block with the set order.                                                                                                                                                                                                                                                       |
| Condition start                  | Carries out condition judgment set in the "condition data" for the designated positioning data, and then executes the "block start data".<br>• When the condition is established, the "block start data" is executed.<br>• When not established, that "block start data" is ignored, and the next point's "block start data" is executed. |
| Wait start                       | Carries out condition judgment set in the "condition data" for the designated positioning data, and then executes the "block start data".<br>• When the condition is established, the "block start data" is executed.<br>• When not established, stops the control until the condition is established. (Waits.)                           |
| Simultaneous start<br>*2         | Simultaneously executes the positioning data having the No. for the axis designated with the "condition data". (Outputs pulses at the same timing.)                                                                                                                                                                                       |
| Repeated start (FOR loop)        | Repeats the program from the "block start data" set with the "FOR loop" to the "block start data" set in "NEXT" for the designated No. of times.                                                                                                                                                                                          |
| Repeated start (FOR condition)   | Repeats the program from the "block start data" set with the "FOR condition" to the "block start data" set in "NEXT" until the conditions set in the "condition data" are established.                                                                                                                                                    |

### ■ High-level positioning control sub functions

"High-level positioning control" uses the "positioning data" set with the "major positioning control". Refer to Section 3.2.4 "Combination of QD75 main functions and sub functions" for details on sub functions that can be combined with the major positioning control.

Note that the sub function Section 12.7.7 "Pre-reading start function" cannot be used together with "high-level positioning control".

### ■ High-level positioning control from peripheral devices

"High-level positioning control" (start of the "block start data") can be executed from GX Configurator-QP test mode.

Refer to GX Configurator-QP Operating Manual for details on starting of the "block start data" from GX Configurator-QP.

### REMARK

Block \*1:

"1 block" is defined as all the data continuing from the positioning data in which "continuous positioning control" or "continuous path control" is set in the operation pattern (Da.1) to the positioning data in which "independent positioning control (Positioning complete)" is set.

Simultaneous start \*2:

Besides the simultaneous start of "block start data" system, the "simultaneous starts" include the "multiple axes simultaneous start control" of control system.  
Refer to Section 10.5 "Multiple axes simultaneous start control" for details.

## 10.1.1 Data required for high-level positioning control

"High-level positioning control" is executed by setting the required items in the "block start data" and "condition data", then starting that "block start data". Judgment about whether execution is possible, etc., is carried out at execution using the "condition data" designated in the "block start data".

"Block start data" can be set for each No. from 7000 to 7004 (called "block Nos."), and up to 50 points can be set for each axis. (This data is controlled with Nos. called "points" to distinguish it from the positioning data. For example, the 1st block start data item is called the "1st point block start data" or "point No. 1 block start data".)

"Condition data" can be set for each No. from 7000 to 7004 (called "block Nos."), and up to 10 data items can be set for each block No.

The "block start data" and "condition data" are set as 1 set for each block No.

The following table shows an outline of the "block start data" and "condition data" stored in the QD75.

| Setting item     |       |                           | Setting details                                                                                                                                                     |
|------------------|-------|---------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Block start data | Da.11 | Shape                     | Set whether to end the control after executing only the "block start data" of the shape itself, or continue executing the "block start data" set in the next point. |
|                  | Da.12 | Start data No.            | Set the "positioning data No." to be executed.                                                                                                                      |
|                  | Da.13 | Special start instruction | Set the method by which the positioning data set in Da.12 will be started.                                                                                          |
|                  | Da.14 | Parameter                 | Set the conditions by which the start will be executed according to the commands set in Da.13. (Designate the "condition data No." and "No. of repetitions".)       |

| Setting item   |       |                    | Setting details                                                                                                                                    |
|----------------|-------|--------------------|----------------------------------------------------------------------------------------------------------------------------------------------------|
| Condition data | Da.15 | Condition target   | Designate the "device", "buffer memory storage details", and "positioning data No." elements for which the conditions are set.                     |
|                | Da.16 | Condition operator | Set the judgment method carried out for the target set in Da.15.                                                                                   |
|                | Da.17 | Address            | Set the buffer memory address in which condition judgment is carried out (only when the details set in Da.15 are "buffer memory storage details"). |
|                | Da.18 | Parameter 1        | Set the required conditions according to the details set in Da.15 and Da.16.                                                                       |
|                | Da.19 | Parameter 2        | Set the required conditions according to the details set in Da.15 and Da.16.                                                                       |

10.1.2 "Block start data" and "condition data" configuration

The "block start data" and "condition data" corresponding to "block No. 7000" can be stored in the buffer memory. (The following drawing shows an example for axis 1.)

(Same for axis 2, axis 3 and axis 4.)

Set in QD75 the " block start data" and "condition data" corresponding to the following "block Nos. 7001 to 7004" using GX Configurator-QP or the sequence program. (The following drawing shows an example for axis 1.)

## 10.2 High-level positioning control execution procedure

High-level positioning control is carried out using the following procedure.

**REMARK**

- \* (1) Five sets of "block start data (50 points)" and "condition data (10 items)" corresponding to "7000" to "7004" are set with a sequence program.
- (2) Five sets of data from "7000" to "7004" can be set when GX Configurator-QP is used. If GX Configurator-QP is used to set the "block start data" and "condition data" corresponding to "7000" to "7004" and write the data to the QD75, "7000" to "7004" can be set in "[Cd. 3] Positioning start No." in STEP 4.

### 10.3 Setting the block start data

#### 10.3.1 Relation between various controls and block start data

The "block start data" must be set to carry out "high-level positioning control". The setting requirements and details of each "block start data" item to be set differ according to the "Da.13 Special start instruction" setting.

The following shows the "block start data" setting items corresponding to various control systems. The operation details of each control type are explained starting in Section 10.3.2. Also refer to Section 10.4 "Setting the condition data for details on "condition data" with which control execution is judged.

(The "block start data" settings in this chapter are assumed to be carried out using GX Configurator-QP.)

| High-level positioning control<br>Block start data setting items |                           |              | Block start<br>(Normal start) | Condition start    | Wait start | Simultaneous start | Repeated start<br>(FOR loop) | Repeated start<br>(FOR condition) | NEXT start * |
|------------------------------------------------------------------|---------------------------|--------------|-------------------------------|--------------------|------------|--------------------|------------------------------|-----------------------------------|--------------|
| Da.11                                                            | Shape                     | 0 : End      | ◎                             | ◎                  | ◎          | ◎                  | ×                            | ×                                 | ◎            |
|                                                                  |                           | 1 : Continue | ◎                             | ◎                  | ◎          | ◎                  | ◎                            | ◎                                 | ◎            |
| Da.12                                                            | Start data No.            |              | 1 to 600                      |                    |            |                    |                              |                                   |              |
| Da.13                                                            | Special start instruction |              | 0                             | 1                  | 2          | 3                  | 4                            | 5                                 | 6            |
| Da.14                                                            | Parameter                 |              | —                             | Condition data No. |            |                    | No. of repetitions           | Condition data No.                | —            |

◎ : One of the two setting items must be set.

○ : Set when required

×

— : Setting not required (Setting value will be ignored. Use the initial value or a value within the setting range.)

\* The "NEXT start" instruction is used in combination with "repeated start (FOR loop)" and "repeated start (FOR condition)". Control using only the "NEXT start" will not be carried out.

#### REMARK

It is recommended that the "block start data" be set whenever possible with GX Configurator-QP. Execution by sequence program uses many sequence programs and devices. The execution becomes complicated, and the scan times will increase.

## 10.3.2 Block start (normal start)

In a "block start (normal start)", the positioning data groups of a block are continuously executed in a set sequence starting from the positioning data set in " [Da.12] Start data No." by one start.

Section [2] shows a control example where the " block start data" and "positioning data" are set as shown in section [1].

## [1] Setting examples

## (1) Block start data setting example

| Axis 1 block start data | [Da.11]<br>Shape | [Da.12]<br>Start data No. | [Da.13]<br>Special start instruction | [Da.14]<br>Parameter |
|-------------------------|------------------|---------------------------|--------------------------------------|----------------------|
| 1st point               | 1: Continue      | 1                         | 0: Block start                       | —                    |
| 2nd point               | 1: Continue      | 2                         | 0: Block start                       | —                    |
| 3rd point               | 1: Continue      | 5                         | 0: Block start                       | —                    |
| 4th point               | 1: Continue      | 10                        | 0: Block start                       | —                    |
| 5th point               | 0: End           | 15                        | 0: Block start                       | —                    |
| •                       |                  |                           |                                      |                      |
| •                       |                  |                           |                                      |                      |

## (2) Positioning data setting example

| Axis 1 positioning data No. | [Da.1]<br>Operation pattern        |             |
|-----------------------------|------------------------------------|-------------|
| 1                           | 00: Positioning complete           |             |
| 2                           | 11: Continuous path control        | } 1 block * |
| 3                           | 01: Continuous positioning control |             |
| 4                           | 00: Positioning complete           | } 1 block   |
| 5                           | 11: Continuous path control        |             |
| 6                           | 00: Positioning complete           |             |
| •                           |                                    |             |
| 10                          | 00: Positioning complete           |             |
| •                           |                                    |             |
| 15                          | 00: Positioning complete           |             |
| •                           |                                    |             |

**REMARK**

Block \* :

"1 block" is defined as all the data continuing from the positioning data in which "continuous positioning control" or "continuous path control" is set in the operation pattern ([Da.1]) to the positioning data in which "independent positioning control (Positioning complete)" is set.

## [2] Control examples

The following shows the control executed when the "block start data" of the 1st point of axis 1 is set as shown in section [1] and started.

<1> The positioning data is executed in the following order before stopping.  
Axis 1 positioning data No. 1 → 2 → 3 → 4 → 5 → 6 → 10 → 15.

Fig. 10.1 Block start control example

## 10.3.3 Condition start

In a "condition start", the "condition data" conditional judgment designated in " [Da.14] Parameter" is carried out for the positioning data set in " [Da.12] Start data No.". If the conditions have been established, the " block start data" set in "1: condition start" is executed. If the conditions have not been established, that " block start data" will be ignored, and the "block start data" of the next point will be executed.

Section [2] shows a control example where the " block start data" and "positioning data" are set as shown in section [1].

## [1] Setting examples

## (1) Block start data setting example

| Axis 1 block start data | [Da.11]<br>Shape | [Da.12]<br>Start data No. | [Da.13]<br>Special start instruction | [Da.14]<br>Parameter |
|-------------------------|------------------|---------------------------|--------------------------------------|----------------------|
| 1st point               | 1: Continue      | 1                         | 1: Condition start                   | 1                    |
| 2nd point               | 1: Continue      | 10                        | 1: Condition start                   | 2                    |
| 3rd point               | 0: End           | 50                        | 0: Block start                       | —                    |
| •                       |                  |                           |                                      |                      |
| •                       |                  |                           |                                      |                      |

\* The "condition data Nos." have been set in " [Da.14] Parameter".

## (2) Positioning data setting example

| Axis 1 position-<br>ing data No. | [Da.1]<br>Operation pattern        |
|----------------------------------|------------------------------------|
| 1                                | 01: Continuous positioning control |
| 2                                | 01: Continuous positioning control |
| 3                                | 00: Positioning complete           |
| •                                |                                    |
| 10                               | 11: Continuous path control        |
| 11                               | 11: Continuous path control        |
| 12                               | 00: Positioning complete           |
| •                                |                                    |
| 50                               | 00: Positioning complete           |
| •                                |                                    |

## [2] Control examples

The following shows the control executed when the " block start data" of the 1st point of axis 1 is set as shown in section [1] and started.

<1> The conditional judgment set in "condition data No. 1" is carried out before execution of the axis 1 "positioning data No. 1".

→ Conditions established → Execute positioning data No. 1, 2, and 3 → Go to <2>.

→ Conditions not established → Go to <2>.

<2> The conditional judgment set in "condition data No. 2" is carried out before execution of the axis 1 "positioning data No. 10".

→ Conditions established → Execute positioning data No. 10, 11, and 12 → Go to <3>.

→ Conditions not established → Go to <3>.

<3> Execute axis 1 "positioning data No. 50" and stop the control.

## 10.3.4 Wait start

In a "wait start", the "condition data" conditional judgment designated in " [Da.14] Parameter" is carried out for the positioning data set in " [Da.12] Start data No.". If the conditions have been established, the " block start data" is executed. If the conditions have not been established, the control stops (waits) until the conditions are established.

Section [2] shows a control example where the " block start data" and "positioning data" are set as shown in section [1].

## [1] Setting examples

## (1) Block start data setting example

| Axis 1 block start data | [Da.11]<br>Shape | [Da.12]<br>Start data No. | [Da.13]<br>Special start instruction | [Da.14]<br>Parameter |
|-------------------------|------------------|---------------------------|--------------------------------------|----------------------|
| 1st point               | 1: Continue      | 1                         | 2: Wait start                        | 3                    |
| 2nd point               | 1: Continue      | 10                        | 0: Block start                       | —                    |
| 3rd point               | 0: End           | 50                        | 0: Block start                       | —                    |
| •                       |                  |                           |                                      |                      |
| •                       |                  |                           |                                      |                      |

\* The "condition data Nos." have been set in " [Da.14] Parameter".

## (2) Positioning data setting example

| Axis 1 position-<br>ing data No. | [Da.1]<br>Operation pattern        |
|----------------------------------|------------------------------------|
| 1                                | 01: Continuous positioning control |
| 2                                | 01: Continuous positioning control |
| 3                                | 00: Positioning complete           |
| •                                |                                    |
| 10                               | 11: Continuous path control        |
| 11                               | 11: Continuous path control        |
| 12                               | 00: Positioning complete           |
| •                                |                                    |
| 50                               | 00: Positioning complete           |
| •                                |                                    |

## [2] Control examples

The following shows the control executed when the " block start data" of the 1st point of axis 1 is set as shown in section [1] and started.

<1> The condition judgment set in "condition data No. 3" is performed to "positioning data No. 1" of the axis 1.

→ Conditions established → Execute positioning data No. 1, 2, and 3 → Go to <2>.

→ Conditions not established → Control stops (waits) until conditions are established → Go to <1>.

<2> Execute the axis 1 "positioning data No. 10, 11, 12, and 50" and stop the control.

## 10.3.5 Simultaneous start

In a "simultaneous start", the positioning data set in the "Da.12 Start data No." and positioning data of other axes set in the "condition data" are simultaneously executed (pulses are output with the same timing).

(The "condition data" is designated with "Da.14 Parameter".)

Section [2] shows a control example where the "block start data" and "positioning data" are set as shown in section [1].

## [1] Setting examples

## (1) Block start data setting example

| Axis 1 block start data | Da.11<br>Shape | Da.12<br>Start data No. | Da.13<br>Special start instruction | Da.14<br>Parameter |
|-------------------------|----------------|-------------------------|------------------------------------|--------------------|
| 1st point               | 0: End         | 1                       | 3: Simultaneous start              | 4                  |
| •                       |                |                         |                                    |                    |
| •                       |                |                         |                                    |                    |
| •                       |                |                         |                                    |                    |
| •                       |                |                         |                                    |                    |

\* It is assumed that the "axis 2 positioning data" for simultaneous starting is set in the "condition data" designated with "Da.14 Parameter".

## (2) Positioning data setting example

| Axis 1 positioning data No. | Da.1<br>Operation pattern          |
|-----------------------------|------------------------------------|
| 1                           | 01: Continuous positioning control |
| 2                           | 01: Continuous positioning control |
| 3                           | 00: Positioning complete           |
| •                           |                                    |
| •                           |                                    |
| •                           |                                    |
| •                           |                                    |
| •                           |                                    |
| •                           |                                    |
| •                           |                                    |

## [2] Control examples

The following shows the control executed when the "block start data" of the 1st point of axis 1 is set as shown in section [1] and started.

<1> Check the axis operation status of axis 2 which is regarded as the simultaneously started axis.

→ Axis 2 is standing by → Go to <2>.

→ Axis 2 is carrying out positioning. → An error occurs and simultaneous start will not be carried out.

<2> Simultaneously start the axis 1 "positioning data No. 1" and axis 2 positioning data set in "condition data No. 4".

### [3] Precautions

Positioning data No. executed by simultaneously started axes is set to condition data (" [Da.18](#) Parameter 1", " [Da.19](#) Parameter 2", but the setting value of start axis (the axis which carries out positioning start) should be "0". If the setting value is set to other than "0", the positioning data set in " [Da.18](#) Parameter 1", " [Da.19](#) Parameter 2" is given priority to be executed rather than " [Da.12](#) Start data No.".

(For details, refer to section 5.5 "List of condition data".)

## 10.3.6 Repeated start (FOR loop)

In a "repeated start (FOR loop)", the data between the " block start data" in which "4: FOR loop" is set in " Da.13 Special start instruction" and the "block start data" in which "6: NEXT start" is set in " Da.13 Special start instruction " is repeatedly executed for the No. of times set in " Da.14 Parameter". An endless loop will result if the No. of repetitions is set to "0".

(The No. of repetitions is set in " Da.14 Parameter" of the " block start data" in which "4: FOR loop" is set in " Da.13 Special start instruction".)

Section [2] shows a control example where the " block start data" and "positioning data" are set as shown in section [1].

## [1] Setting examples

## (1) Block start data setting example

| Axis 1 block start data | Da.11<br>Shape | Da.12<br>Start data No. | Da.13<br>Special start instruction | Da.14<br>Parameter |
|-------------------------|----------------|-------------------------|------------------------------------|--------------------|
| 1st point               | 1: Continue    | 1                       | 4: FOR loop                        | 2                  |
| 2nd point               | 1: Continue    | 10                      | 0: Block start                     | —                  |
| 3rd point               | 0: End         | 50                      | 6: NEXT start                      | —                  |
| •                       |                |                         |                                    |                    |
| •                       |                |                         |                                    |                    |

\* The "condition data Nos." have been set in " Da.14 Parameter".

## (2) Positioning data setting example

| Axis 1 positioning data No. | Da.1<br>Operation pattern          |
|-----------------------------|------------------------------------|
| 1                           | 01: Continuous positioning control |
| 2                           | 01: Continuous positioning control |
| 3                           | 00: Positioning complete           |
| •                           |                                    |
| 10                          | 11: Continuous path control        |
| 11                          | 00: Positioning complete           |
| •                           |                                    |
| 50                          | 01: Continuous positioning control |
| 51                          | 00: Positioning complete           |
| •                           |                                    |

## [2] Control examples

The following shows the control executed when the " block start data" of the 1st point of axis 1 is set as shown in section [1] and started.

<1> Execute the axis 1 "positioning data No. 1, 2, 3, 10, 11, 50, and 51".

<2> Return to the axis 1 "1st point block start data". Again execute the axis 1 "positioning data No. 1, 2, 3, 10, 11, 50 and 51", and then stop the control. (Repeat for the No. of times (2 times) set in Da.14.)

## 10.3.7 Repeated start (FOR condition)

In a "repeated start (FOR condition)", the data between the " block start data" in which "5: FOR condition" is set in " Da.13 Special start instruction" and the " block start data" in which "6: NEXT start" is set in " Da.13 Special start instruction" is repeatedly executed until the establishment of the conditions set in the "condition data". Conditional judgment is carried out as soon as switching to the point of "6: NEXT start" (before positioning of NEXT start point). (The "condition data" designation is set in " Da.14 Parameter" of the " block start data" in which "5: FOR condition" is set in " Da.13 Special start instruction".)

Section [2] shows a control example where the " block start data" and "positioning data" are set as shown in section [1].

## [1] Setting examples

## (1) Block start data setting example

| Axis 1 block start data | Da.11<br>Shape | Da.12<br>Start data No. | Da.13<br>Special start instruction | Da.14<br>Parameter |
|-------------------------|----------------|-------------------------|------------------------------------|--------------------|
| 1st point               | 1: Continue    | 1                       | 5: FOR condition                   | 5                  |
| 2nd point               | 1: Continue    | 10                      | 0: Block start                     | —                  |
| 3rd point               | 0: End         | 50                      | 6: NEXT start                      | —                  |
| •                       |                |                         |                                    |                    |
| •                       |                |                         |                                    |                    |

\* The "condition data Nos." have been set in " Da.14 Parameter".

## (2) Positioning data setting example

| Axis 1 position-<br>ing data No. | Da.1<br>Operation pattern          |
|----------------------------------|------------------------------------|
| 1                                | 01: Continuous positioning control |
| 2                                | 01: Continuous positioning control |
| 3                                | 00: Positioning complete           |
| •                                |                                    |
| 10                               | 11: Continuous path control        |
| 11                               | 00: Positioning complete           |
| •                                |                                    |
| 50                               | 01: Continuous positioning control |
| 51                               | 00: Positioning complete           |
| •                                |                                    |

## [2] Control examples

The following shows the control executed when the " block start data" of the 1st point of axis 1 is set as shown in section [1] and started.

<1> Execute axis 1 "Positioning data No. 1, 2, 3, 10, 11".

<2> Execute the conditional judgment set in axis 1 "Condition data No.5". \*1  
 → Conditions not established → Execute "Positioning data No. 50, 51".  
 Go to <1>  
 → Conditions established → Execute "Positioning data No.50, 51" and complete the positioning.

\*1: Conditional judgment is carried out as soon as switching to NEXT start point (before positioning of NEXT start point).

## 10.3.8 Restrictions when using the NEXT start

The "NEXT start" is a instruction indicating the end of the repetitions when executing Section 10.3.6 "Repeated start (FOR loop)" and Section 10.3.7 "Repeated start (FOR condition)".

The following shows the restrictions when setting "6: NEXT start" in the " block start data".

- (1) The processing when "6: NEXT start" is set before execution of "4: FOR loop" or "5: FOR condition" is the same as that for a "0: block start".
- (2) Repeated processing will not be carried out if there is no "6: NEXT start" instruction after the "4: FOR loop" or "5: FOR condition" instruction. (Note that an "error" will not occur.)
- (3) Nesting is not possible between "4: FOR loop" and "6: NEXT start", or between "5: FOR condition" and "6: NEXT start". A warning "FOR to NEXT nest construction" (warning code: 506) will occur if nesting is attempted.

[Operating examples without nesting structure]

| Start block data | Da.13 Special start instruction |
|------------------|---------------------------------|
| 1st point        | Normal start                    |
| 2nd point        | FOR ←                           |

A warning will occur when starting the 4th point "FOR".

The JUMP destination of the 7th point "NEXT" is the 4th point. The 9th point "NEXT" is processed as normal start.

## 10.4 Setting the condition data

### 10.4.1 Relation between various controls and the condition data

"Condition data" is set in the following cases.

- (1) When setting conditions during execution of Section 9.2.23 "JUMP instruction" (major positioning control)
- (2) When setting conditions during execution of "high-level positioning control"

The "condition data" to be set includes the 5 setting items from [Da.15] to [Da.19], but the setting requirements and details differ according to the control system and setting conditions.

The following shows the "condition data" " [Da.15] Condition target" corresponding to the different types of control.

(The "condition data" settings in this chapter are assumed to be carried out using GX Configurator-QP.)

| Control type<br>[Da.15]<br>Setting item | High-level positioning control |            |                    |                                | Major positioning control |
|-----------------------------------------|--------------------------------|------------|--------------------|--------------------------------|---------------------------|
|                                         | Block start                    | Wait start | Simultaneous start | Repeated start (For condition) | JUMP instruction          |
| 01: Device X*1                          | ◎                              | ◎          | ×                  | ◎                              | ◎                         |
| 02: Device Y*1                          | ◎                              | ◎          | ×                  | ◎                              | ◎                         |
| 03: Buffer memory (1 word)              | ◎                              | ◎          | ×                  | ◎                              | ◎                         |
| 04: Buffer memory (2 words)             | ◎                              | ◎          | ×                  | ◎                              | ◎                         |
| 05: Positioning data No.                | ×                              | ×          | ◎                  | ×                              | ×                         |

◎ : One of the setting items must be set.

× : Setting not possible

\*1: Refers to buffer memories and devices X/Y which belongs to QD75.

#### REMARK

It is recommended that the "condition data" be set whenever possible with GX Configurator-QP. Execution by sequence program uses many sequence programs and devices. The execution becomes complicated, and the scan times will increase.

The setting requirements and details of the following "condition data" [Da.16] to [Da.19] setting items differ according to the "[Da.15] Condition target" setting. The following shows the [Da.16] to [Da.19] setting items corresponding to the "[Da.15] Condition target".

| <div>Other setting item</div> <div><div>Da.15</div>Setting item</div>                                                                                                                                                                                                                      | <div>Da.16</div> Condition operator  | <div>Da.17</div> Address                                                                                                                                                                                                                             | <div>Da.18</div> Parameter 1 |                   | <div>Da.19</div> Parameter 2                                              |                   |                                |                                |                    |                                |

|                                                                                                                                                                                                                                                                                            |                                      |                                                                                                                                                                                                                                                      |                              |                   |                                                                           |                   |                                |                                |                    |                                |

— : Setting not required (Setting value will be ignored. Use the initial value or a value within the setting range.)

\*\* : Value stored in buffer memory designated in [Da.17].

\*1 : Comparison of ≤ and ≥ is judged as signed values. Refer to Section 5.5 "List of condition data" for the setting contents.

\*2 : The setting value of start axis (the axis which executes positioning start) should be "0". If the setting value is set to other than "0", the positioning data set in [Da.18] Parameter 1 and [Da.19] Parameter 2 is given priority to be executed rather than "[Da.12] Start data No.".

Judgment whether the condition operator is "=" or "≠" at the wait start.  
Judgment on data is carried out for each control cycle of the QD75. Thus, in the judgment on the data such as current feed value which varies continuously, the operator "=" may not be detected. If this occurs, use a range operator.

**REMARK**

The "PLC CPU memory area" can be designated as the buffer memory address to be designated in [Da.17](#). (Refer to Section 7.1.1 "Configuration and roles of QD75 memory".)

## 10.4.2 Condition data setting examples

The following shows setting examples for "condition data".

## (1) Setting the device ON/OFF as a condition

[Condition] Device "XC" (= Axis 1 Busy signal) is OFF

| Da.15<br>Condition target | Da.16<br>Condition operator | Da.17<br>Address | Da.18<br>Parameter 1 | Da.19<br>Parameter 2 |
|---------------------------|-----------------------------|------------------|----------------------|----------------------|
| 01H: Device X             | 08H: DEV=OFF                | —                | 0CH                  | —                    |

## (2) Setting the numeric value stored in the "buffer memory" as a condition

[Condition]

The value stored in buffer memory addresses "800, 801" (= "Md.20 Current feed value") is "1000" or larger.

| Da.15<br>Condition target    | Da.16<br>Condition operator | Da.17<br>Address | Da.18<br>Parameter 1 | Da.19<br>Parameter 2 |
|------------------------------|-----------------------------|------------------|----------------------|----------------------|
| 04H: Buffer memory (2 words) | 04H: * * ≥ P1               | 800              | 1000                 | —                    |

## (3) Designating the axis and positioning data No. to be simultaneously started in "simultaneous start"

[Condition]

Simultaneously starting "axis 2 positioning data No.3".

| Da.15<br>Condition target | Da.16<br>Condition operator | Da.17<br>Address | Da.18<br>Parameter 1          | Da.19<br>Parameter 2 |
|---------------------------|-----------------------------|------------------|-------------------------------|----------------------|
| 05H: Positioning data No. | 20H: Axis 2 designation     | —                | High-order 16 bits "0003H" *1 | — *1                 |

\*1: The setting value of start axis (the axis which executes positioning start) should be "0000H".

## 10.5 Multiple axes simultaneous start control

The "multiple axes simultaneous start control" starts and controls the multiple axes simultaneously by outputting pulses to the axis to be started at the same timing as the start axis.

The maximum of four axes can be started simultaneously.

### [1] Control details

Multiple axes simultaneous start control is executed as follows.

Set the start data No. to the buffer memory areas " [Cd.30] to [Cd.33]

Simultaneous starting axis start data No. (axis 1 to 4 start data No.).

Set "9004" to " [Cd.3] Positioning start No." of the start axis.

Turn ON the positioning start signal.

### [2] Restrictions

- (1) The error "Error before simultaneous start" (error code: 501) will occur and all simultaneously started axes will not start if the simultaneously started axis start data No. is not set to the axis control data on the start axis or set outside the setting range.
- (2) The error "Error before simultaneous start" (error code: 501) will occur and all simultaneously started axes will not start if either of the simultaneously started axes is BUSY.
- (3) The error "Error before simultaneous start" (error code: 501) will occur and all simultaneously started axes will not start if an error occurs during the analysis of the positioning data on the simultaneously started axes.
- (4) No error or warning will occur if only the start axis is the simultaneously started axis.
- (5) This function cannot be used with the sub function Section 12.7.7 "Pre-reading start function".

### [3] Multiple axes simultaneous start control procedure

The procedure for multiple axes simultaneous start control is as follows.

## [4] Multiple axes simultaneous start control function setting method

The following shows the setting of the data used to execute the multiple axes simultaneous start control with positioning start signals (The axis control data on the start axis is set).

| Setting item                                                                   | Setting value                                                                                                            | Setting details                                                    | Buffer memory address |        |        |        |
|--------------------------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------|--------------------------------------------------------------------|-----------------------|--------|--------|--------|
|                                                                                |                                                                                                                          |                                                                    | Axis 1                | Axis 2 | Axis 3 | Axis 4 |

## 10.6 Start program for high-level positioning control

### 10.6.1 Starting high-level positioning control

To execute high-level positioning control, a sequence program must be created to start the control in the same method as for major positioning control.

The following shows the procedure for starting the "1st point block start data" (regarded as block No. 7000) set in axis 1.

Fig. 10.2 High-level positioning control start procedure

## 10.6.2 Example of a start program for high-level positioning control

The following shows an example of a start program for high-level positioning control in which the 1st point "block start data" of axis 1 is started. (The block No. is regarded as "7000".)

### ■ Control data that require setting

The following control data must be set to execute high-level positioning control. The setting is carried out using a sequence program.

| Setting item                               | Setting value | Setting details                                            | Buffer memory address |        |        |        |
|--------------------------------------------|---------------|------------------------------------------------------------|-----------------------|--------|--------|--------|
|                                            |               |                                                            | Axis 1                | Axis 2 | Axis 3 | Axis 4 |
| <b>Cd.3</b> Positioning start No.          | 7000          | Set "7000" to indicate control using "block start data".   | 1500                  | 1600   | 1700   | 1800   |
| <b>Cd.4</b> Positioning starting point No. | 1             | Set the point No. of the "block start data" to be started. | 1501                  | 1601   | 1701   | 1801   |

\* Refer to Section 5.7 "List of control data" for details on the setting details.

### ■ Start conditions

The following conditions must be fulfilled when starting the control. The required conditions must also be integrated into the sequence program, and configured so the control does not start unless the conditions are fulfilled.

| Signal name      |                         | Signal state |                                               | Device |        |        |        |
|------------------|-------------------------|--------------|-----------------------------------------------|--------|--------|--------|--------|
|                  |                         |              |                                               | Axis 1 | Axis 2 | Axis 3 | Axis 4 |

| •                                |                             |

#### (3) Start time chart

Fig. 10.3 Start time chart for high-level positioning control (block start)

### ■ Creating the program

#### Example

Set the block start data beforehand.

Y10: Positioning start signal  
X10: Start complete signal  
M104: Positioning start command pulse

# MEMO

[illegible]

# CHAPTER 11 MANUAL CONTROL

The details and usage of manual control are explained in this chapter.  
In manual control, pulse output commands are issued during a JOG operation and an inching operation executed by the turning ON of the JOG START signal, or from a manual pulse generator connected to the QD75.  
Manual control using a sequence program from the CPU module is explained in this chapter. Refer to GX Configurator-QP Operating Manual for an explanation of manual control (JOG operation, inching operation and manual pulse generator operation) using the peripheral devices.

## 11.1 Outline of manual control

### 11.1.1 Three manual control methods

"Manual control" refers to control in which positioning data is not used, and a positioning operation is carried out in response to signal input from an external source. The three types of this "manual control" are explained below.

#### [1] JOG operation

"JOG operation" is a control method in which the machine is moved by only a movement amount (pulses are continuously outputted while the JOG START signal is ON). This operation is used to move the workpiece in the direction in which the limit signal is ON, when the operation is stopped by turning the limit signal OFF to confirm the positioning system connection and obtain the positioning data address (Refer to Section 12.7.4 "Teaching function").

Fig. 11.1 JOG operation

#### [2] Inching operation

"Inching operation" is a control method in which a minute movement amount of pulses is output manually at 1.8ms.

When the "inching movement amount" of the axis control data is set by JOG operation, the workpiece is moved by a set movement amount. (When the "inching movement amount" is set to "0", the operation is performed as the JOG operation.)

Fig. 11.2 Inching operation

### [3] Manual pulse generator operation

"Manual pulse generator operation" is a control method in which positioning is carried out in response to the No. of pulses input from a manual pulse generator (the No. of input pulses is output). This operation is used for manual fine adjustment, etc., when carrying out accurate positioning to obtain the positioning address.

Fig. 11.3 Manual pulse generator control

#### Manual control sub functions

Refer to Section 3.2.4 "Combination of QD75 major functions and sub functions" for details on "sub functions" that can be combined with manual control. Also refer to CHAPTER 12 "CONTROL SUB FUNCTIONS" for details on each sub function.

#### Carrying out manual control from peripheral devices

"JOG operation", "Inching operation" and enabling/disabling of the "manual pulse generator operation" can be executed from GX Configurator-QP test mode. Refer to GX Configurator-QP Operating Manual for details on manual control from GX Configurator-QP.

#### Monitoring manual control

Refer to Section 5.6 "List of monitor data" when directly monitoring the buffer memory using GX Developer. Also refer to GX Configurator-QP Operating Manual when monitoring with the monitor functions of GX Configurator-QP.

## 11.2 JOG operation

### 11.2.1 Outline of JOG operation

#### Important

Use the hardware stroke limit function when carrying out JOG operation near the upper or lower limits. (Refer to Section 12.4.4).

\* If the hardware stroke limit function is not used, the workpiece may exceed the moving range, causing an accident.

#### ■ JOG operation

In JOG operation, the FORWARD run JOG start signal (Y8, YA, YC, YE) or REVERSE run JOG start signal (Y9, YB, YD, YF) turns ON, causing pulses to be output to the drive unit from the QD75 while the signal is ON. The workpiece is then moved in the designated direction.

The following shows examples of JOG operation.

|    |                                                                                                                                                                                                                                                                        |
|----|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 1) | When the START signal turns ON, acceleration begins in the direction designated by the START signal, and continues for the acceleration time designated in " [Pr.32] JOG operation acceleration time selection". At this time, the BUSY signal changes from OFF to ON. |
| 2) | When the workpiece being accelerated reaches the speed set in " [Cd.17] JOG speed", the movement continues at this speed.<br>The constant speed movement takes place at 2) and 3).                                                                                     |
| 3) | When the START signal is turned OFF, deceleration begins from the speed set in " [Cd.17] JOG speed", and continues for the deceleration time designated in " [Pr.33] JOG operation deceleration time selection".                                                       |
| 4) | The operation stops when the speed becomes "0". At this time, the BUSY signal changes from ON to OFF.                                                                                                                                                                  |

Fig. 11.4 JOG operation

### ■ Precautions during operation

- (1) For safety, first set " **Cd.17** JOG speed" to a smaller value and check the movement. Then gradually increase the value.
- (2) The axis error "Outside JOG speed range" (error code: 300) will occur and the operation will not start if the "JOG speed" is outside the setting range at the JOG start.
- (3) The axis error "JOG speed limit value error" (error code: 956) will occur and the operation will not start if " **Pr.31** JOG speed limit value" is set to a value larger than " **Pr.8** Speed limit value".
- (4) If " **Cd.17** JOG speed" exceeds the speed set in " **Pr.31** JOG speed limit value", the workpiece will move at the " **Pr.31** JOG speed limit value" and the warning "JOG speed limit value" (warning code: 301) will occur in the QD75.
- (5) The JOG operation can be continued even if an "Axis warning" has occurred.
- (6) Set a "0" in " **Cd.16** Inching movement amount". If a value other than "0" is set, the operation will become an inching operation (Refer to Section 11.3 "Inching operation").

### ■ Operations when stroke limit error occurs

When the operation is stopped by hardware stroke limit error or software stroke limit error, the JOG operation can execute in an opposite way (direction within normal limits) after an error reset. (An error will occur again if JOG start signal is turned ON in a direction to outside the stroke limit.)

### ■ JOG operation timing and processing time

The following drawing shows details of the JOG operation timing and processing time.

Fig. 11.5 JOG operation timing and processing times

#### Normal timing times

| Model           | t1           | t2         | t3           | t4         |
|-----------------|--------------|------------|--------------|------------|
| QD75P□N/QD75D□N | 1.0 to 3.0ms | 0 to 0.9ms | 1.3 to 2.2ms | 0 to 0.9ms |
| QD75P□/QD75D□   | 1.0 to 3.0ms | 0 to 1.8ms | 2.7 to 4.4ms | 0 to 1.8ms |

- Delays may occur in the t1 timing time due to the operation status of other axes.

## 11.2.2 JOG operation execution procedure

The JOG operation is carried out by the following procedure.

**REMARK**

- Mechanical elements such as limit switches are considered as already installed.
- Parameter settings work in common for all control using the QD75.

## 11.2.3 Setting the required parameters for JOG operation

The "Parameters" must be set to carry out JOG operation.

The following table shows the setting items of the required parameters for carrying out JOG operation. When only JOG operation will be carried out, no parameters other than those shown below need to be set. (Use the initial values or setting values within a range where no error occurs for trouble-free operation.)

| Setting item |                                                             | Setting requirement | Factory-set initial value<br>(setting details)          |
|--------------|-------------------------------------------------------------|---------------------|---------------------------------------------------------|
| Parameters   | Pr.1 Unit setting                                           | ◎                   | 3 (pulse)                                               |
|              | Pr.2 No. of pulses per rotation (Ap) (Unit: pulse)          | ◎                   | 20000                                                   |
|              | Pr.3 Movement amount per rotation (Al) (Unit: pulse)        | ◎                   | 20000                                                   |
|              | Pr.4 Unit magnification (Am)                                | ◎                   | 1 (1-fold)                                              |
|              | Pr.5 Pulse output mode                                      | ◎                   | 1 (CW/CCW mode)                                         |
|              | Pr.6 Rotation direction setting                             | ◎                   | 0 (current value increases by forward run pulse output) |
|              | Pr.7 Bias speed at start (Unit: pulse/s)                    | ○                   | 0                                                       |
|              | Pr.8 Speed limit value (Unit: pulse/s)                      | ◎                   | 200000                                                  |

|              | Pr.14 Software stroke limit selection                       | ○                   | 0 (current feed value)                                  |
|              | Pr.15 Software stroke limit valid/invalid setting           | ○                   | 0 (valid)                                               |
|              | Pr.17 Torque limit setting value (Unit: %)                  | ○                   | 300                                                     |
|              | Pr.23 Output signal logic selection                         | ○                   | 0 (Pulse output to drive unit is negative logic.)       |

◎ : Setting always required.

○ : Set according to requirements (Leave set to the initial value when not used.)

**REMARK**

- Parameter settings work in common for all control using the QD75. When carrying out other control ("major positioning control", "high-level positioning control", "OPR positioning control"), the respective setting items must also be matched and set.
- Parameters are set for each axis.
- Refer to CHAPTER 5 "DATA USED FOR POSITIONING CONTROL" for setting details.

| Setting item |       |                                             | Setting requirement | Factory-set initial value<br>(setting details)           |

|              | Pr.39 | Stop group 3 sudden stop selection          | ○                   | 0 (deceleration stop)                                    |

◎ : Setting always required.

○ : Set according to requirements (Leave set to the initial value when not used.)

### 11.2.4 Creating start programs for JOG operation

A sequence program must be created to execute a JOG operation. Consider the "required control data setting", "start conditions" and "start time chart" when creating the program.

The following shows an example when a JOG operation is started for axis 1.  
(" [Cd.17] JOG speed" is set to "100.00mm/min" in the example shown.)

#### ■ Required control data setting

The control data shown below must be set to execute a JOG operation. The setting is carried out with the sequence program.

| Setting item                    | Setting value | Setting details                                                                                                             | Buffer memory address |        |        |        |
|---------------------------------|---------------|-----------------------------------------------------------------------------------------------------------------------------|-----------------------|--------|--------|--------|
|                                 |               |                                                                                                                             | Axis 1                | Axis 2 | Axis 3 | Axis 4 |
| [Cd.16] Inching movement amount | 0             | Set "0".                                                                                                                    | 1517                  | 1617   | 1717   | 1817   |

|                                 |               |                                                                                                                             | 1519                  | 1619   | 1719   | 1819   |

\* Refer to Section 5.7 "List of control data" for details on the setting details.

#### ■ Start conditions

The following conditions must be fulfilled when starting. The required conditions must also be assembled in the sequence program, and the sequence program must be configured so the operation will not start if the conditions are not fulfilled.

| Signal name      |                         | Signal state |                                               | Device |        |        |        |
|------------------|-------------------------|--------------|-----------------------------------------------|--------|--------|--------|--------|
|                  |                         |              |                                               | Axis 1 | Axis 2 | Axis 3 | Axis 4 |
| Interface signal | PLC READY signal        | ON           | CPU module preparation completed              | Y0     |        |        |        |
|                  | QD75 READY signal       | ON           | QD75 preparation completed                    | X0     |        |        |        |
|                  | Synchronization flag *  | ON           | QD75 buffer memory<br>The access is possible. | X1     |        |        |        |
|                  | Axis stop signal        | OFF          | Axis stop signal is OFF                       | Y4     | Y5     | Y6     | Y7     |
|                  | Start complete signal   | OFF          | Start complete signal is OFF                  | X10    | X11    | X12    | X13    |
|                  | BUSY signal             | OFF          | QD75 is not operating                         | XC     | XD     | XE     | XF     |
|                  | Error detection signal  | OFF          | There is no error                             | X8     | X9     | XA     | XB     |
|                  | M code ON signal        | OFF          | M code ON signal is OFF                       | X4     | X5     | X6     | X7     |
| External signal  | Drive unit READY signal | ON           | Drive unit preparation completed              | —      |        |        |        |
|                  | Stop signal             | OFF          | Stop signal is OFF                            | —      |        |        |        |
|                  | Upper limit (FLS)       | ON           | Within limit range                            | —      |        |        |        |
|                  | Lower limit (RLS)       | ON           | Within limit range                            | —      |        |        |        |

\* If the CPU module is set to the asynchronous mode in the synchronization setting, this must be inserted in the program for interlocking. If it is set to the synchronous mode, it must not be inserted in the program for interlocking because it is turned ON when the CPU module executes calculation.

■ Start time chart

Fig. 11.6 JOG operation start time chart

## ■ Creating the program

### Example

\*

\* No. 10 JOG operation setting program

\*

\* No.12 JOG operation/inching operation execution program

## 11.2.5 JOG operation example

■ When the "stop signal" is turned ON during JOG operation

When the "stop signal" is turned ON during JOG operation, the JOG operation will stop by the "deceleration stop" method.

An error "Stop signal ON at start" (error code 106) will occur if JOG start signal is turned ON while the stop signal is ON.

The operation can be started by turning the stop signal OFF, and turning the JOG start signal from OFF to ON again.

Fig. 11.7 Operation when the stop signal is turned ON during JOG operation

■ When both the "forward run JOG start signal" and "reverse run JOG start signal" are turned ON simultaneously for one axis

When both the "forward run JOG start signal" and "reverse run JOG start signal" are turned ON simultaneously for one axis, the "forward run JOG start signal" is given priority. In this case, the "reverse run JOG start signal" is validated when the QD75 BUSY signal is turned OFF.

If the forward run JOG operation is stopped due to stop or axis error by a stop signal, the reverse run JOG operation will not be executed even if the "reverse run JOG start signal" turns ON.

Fig. 11.8 Operation when both the forward run JOG start signal and reverse run JOG start signal are turned ON simultaneously

- When the "JOG start signal" is turned ON again during deceleration caused by the ON → OFF of the "JOG start signal"

When the "JOG start signal" is turned ON again during deceleration caused by the ON → OFF of the "JOG start signal", the JOG operation will be carried out from the time the "JOG start signal" is turned ON.

Fig. 11.9 Operation when the JOG start signal is turned ON during deceleration

- When the "JOG start signal" is turned ON during a peripheral device test mode

When the "JOG start signal" is turned ON during a peripheral device test mode, it will be ignored and the JOG operation will not be carried out.

Fig. 11.10 Operation when the JOG start signal is turned ON during a test mode

## 11.3 Inching operation

### 11.3.1 Outline of inching operation

#### Important

When the inching operation is carried out near the upper or lower limit, use the hardware stroke limit function (Refer to Section 12.4.4).

\* If the hardware stroke limit function is not used, the workpiece may exceed the movement range, and an accident may result.

#### ■ Inching operation

In inching operation, pulses are input to the drive unit at 1.8ms to move the workpiece by a designated movement amount after the forward run JOG start signal [Y8, YA, YC, YE] or reverse JOG start signal [Y9, YB, YD, YF] is turned ON. The following shows the example of inching operation.

|    |                                                                                                                                                                           |
|----|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 1) | When the start signal is turned ON, inching operation is carried out in the direction designated by the start signal. In this case, BUSY signal is turned from OFF to ON. |
| 2) | The workpiece is moved by a movement amount set in " <u>Cd.16</u> Inching movement amount".                                                                               |
| 3) | The workpiece movement stops when the speed becomes "0". In this case, BUSY signal is turned from ON to OFF. The positioning complete signal is turned from OFF to ON.    |
| 4) | The positioning complete signal is turned from ON to OFF after a time set in " <u>Pr.40</u> Positioning complete signal output time" has been elapsed.                    |

Fig. 11.11 Inching operation

### ■ Precautions during operation

- (1) Acceleration/deceleration processing is not carried out during inching operation. (Pulses corresponding to the designated inching movement amount are output at 1.8ms. The movement direction of inching operation is reversed and, when backlash compensation is carried out, first pulses corresponding to the backlash amount are output at 1.8ms and then pulses corresponding to the designated inching movement amount are output in the next 1.8ms.)  
The " [Cd.17] JOG speed" is ignored even if it is set. However, the error "Inching movement amount error" (error code: 301) will occur in the following cases:

$([Cd.16] \text{ Inching movement amount}) \times (A) > ([Pr.31] \text{ JOG speed limit value})$

Where (A) is as follows.

- When the unit is pulse: 562.5
- When the unit is other than pulse: 337.5

- (2) Set a value other than a "0" in " [Cd.16] Inching movement amount".  
If a "0" is set, the operation will become JOG operation (Refer to Section 11.2 "JOG operation").

### ■ Operations when stroke limit error occurs

When the operation is stopped by hardware stroke limit error or software stroke limit error, the inching operation can be performed in an opposite way (direction within normal limits) after an error reset. (An error will occur again if JOG start signal is turned ON in a direction to outside the stroke limit.)

### ■ Inching operation timing and processing times

The following drawing shows the details of the inching operation timing and processing time.

Fig. 11.12 Inching operation timing and processing times

#### Normal timing times

| Model           | t1           | t2           | t3         | t4                      |
|-----------------|--------------|--------------|------------|-------------------------|
| QD75P□N/QD75D□N | 1.0 to 3.0ms | 1.3 to 2.2ms | 0 to 0.9ms | Depending on parameters |
| QD75P□/QD75D□   | 1.0 to 3.0ms | 2.7 to 4.4ms | 0 to 1.8ms |                         |

- Depending on the operating statuses of the other axes, delay may occur in the t1 timing time.

## 11.3.2 Inching operation execution procedure

The inching operation is carried out by the following procedure.

**REMARK**

- Mechanical elements such as limit switches are considered as already installed.
- Parameter settings work in common for all control using the QD75.

## 11.3.3 Setting the required parameters for inching operation

The "Parameters" must be set to carry out inching operation.

The following table shows the setting items of the required parameters for carrying out inching operation. When only inching operation will be carried out, no parameters other than those shown below need to be set. (Use the initial values or setting values within a range where no error occurs for trouble-free operation.)

| Setting item |                                                             | Setting requirement | Factory-set initial value<br>(setting details)          |
|--------------|-------------------------------------------------------------|---------------------|---------------------------------------------------------|
| Parameters   | Pr.1 Unit setting                                           | ◎                   | 3 (pulse)                                               |
|              | Pr.2 No. of pulses per rotation (Ap) (Unit: pulse)          | ◎                   | 20000                                                   |
|              | Pr.3 Movement amount per rotation (Al) (Unit: pulse)        | ◎                   | 20000                                                   |
|              | Pr.4 Unit magnification (Am)                                | ◎                   | 1 (1-fold)                                              |
|              | Pr.5 Pulse output mode                                      | ◎                   | 1 (CW/CCW mode)                                         |
|              | Pr.6 Rotation direction setting                             | ◎                   | 0 (current value increases by forward run pulse output) |
|              | Pr.11 Backlash compensation amount (Unit: pulse)            | ○                   | 0                                                       |
|              | Pr.12 Software stroke limit upper limit value (Unit: pulse) | ○                   | 2147483647                                              |
|              | Pr.13 Software stroke limit lower limit value (Unit: pulse) | ○                   | -2147483648                                             |
|              | Pr.14 Software stroke limit selection                       | ○                   | 0 (current feed value)                                  |
|              | Pr.15 Software stroke limit valid/invalid setting           | ○                   | 0 (valid)                                               |
|              | Pr.17 Torque limit setting value (Unit: %)                  | ○                   | 300                                                     |
|              | Pr.23 Output signal logic selection                         | ○                   | 0 (Pulse output to the drive unit is negative logic)    |
|              | Pr.31 JOG speed limit value (Unit: pulse/s)                 | ◎                   | 20000                                                   |

◎ : Setting always required.

○ : Set according to requirements (Leave set to the initial value when not used.)

**REMARK**

- Parameter settings work in common for all control using the QD75. When carrying out other controls ("major positioning control", "high-level positioning control", and "OPR positioning control"), the respective setting items must also be set.
- Parameters are set for each axis.
- Refer to CHAPTER 5 "DATA USED FOR POSITIONING CONTROL" for setting details.

### 11.3.4 Creating a program to enable/disable the inching operation

A sequence program must be created to execute an inching operation. Consider the "required control data setting", "start conditions", and "start time chart" when creating the program.

The following shows an example when an inching operation is started for axis 1. (The example shows the inching operation when a "10.0  $\mu$ m" is set in "Cd.16 Inching movement amount".)

#### ■ Required control data setting

The control data shown below must be set to execute an inching operation. The setting is carried out with the sequence program.

| Setting item | Setting value           | Setting details                                                                                                                                                                                        | Buffer memory address |        |        |        |
|--------------|-------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-----------------------|--------|--------|--------|
|              |                         |                                                                                                                                                                                                        | Axis 1                | Axis 2 | Axis 3 | Axis 4 |
| Cd.16        | Inching movement amount | 100<br>Set the setting value so that the command pulse is not increased larger than the maximum output pulse.<br>(The max. output pulse<br>QD75D□N: 4Mpps<br>QD75D□: 1Mpps<br>QD75P□N/QD75P□: 200kpps) | 1517                  | 1617   | 1717   | 1817   |

\* Refer to Section 5.7 "List of control data" for information on setting details.

#### ■ Start conditions

The following conditions must be fulfilled when starting. The required conditions must also be assembled in the sequence program, and the sequence program must be configured so the operation will not start if the conditions are not fulfilled.

| Signal name      |                             | Signal state |                                    | Device |        |        |        |
|------------------|-----------------------------|--------------|------------------------------------|--------|--------|--------|--------|
|                  |                             |              |                                    | Axis 1 | Axis 2 | Axis 3 | Axis 4 |
| Interface signal | PLC READY signal            | ON           | CPU module preparation completed   | Y0     |        |        |        |
|                  | QD75 READY signal           | ON           | QD75 preparation completed         | X0     |        |        |        |
|                  | Synchronization flag *      | ON           | Accessible to QD75 buffer memory   | X1     |        |        |        |
|                  | Axis stop signal            | OFF          | Axis stop signal is OFF            | Y4     | Y5     | Y6     | Y7     |
|                  | Start complete signal       | OFF          | Start complete signal is OFF       | X10    | X11    | X12    | X13    |
|                  | BUSY signal                 | OFF          | QD75 is not operating              | XC     | XD     | XE     | XF     |
|                  | Positioning complete signal | OFF          | Positioning complete signal is OFF | X14    | X15    | X16    | X17    |
|                  | Error detection signal      | OFF          | There is no error                  | X8     | X9     | XA     | XB     |
| External signal  | M code ON signal            | OFF          | M code ON signal is OFF            | X4     | X5     | X6     | X7     |

|                  | Stop signal                 | OFF          | Stop signal is OFF                 | —      |        |        |        |
|                  | Upper limit (FLS)           | ON           | Within limit range                 | —      |        |        |        |
|                  | Lower limit (RLS)           | ON           | Within limit range                 | —      |        |        |        |

\* If the CPU module is set to the asynchronous mode in the synchronization setting, this must be inserted in the program for interlocking. If it is set to the synchronous mode, it must not be inserted in the program for interlocking because it is turned ON when the CPU module executes calculation.

■ Start time chart

Fig. 11.13 Inching operation start time chart

### ■ Creating the program

#### Example

\*  
\* No.11 Inching operation setting program  
\*

\* No.12 JOG operation/inching operation execution program

## 11.3.5 Inching operation example

■ When executing inching operation while stop signal is turned ON:

If the JOG start signal is turned ON while the stop signal is ON, an error "Stop signal ON at start" (error code: 106) will occur.

The inching operation can be re-started when the stop signal is turned OFF and the JOG start signal is turned OFF and then turned ON.

Fig. 11.14 Operation when executing inching operation while stop signal is ON

■ When "JOG start signal" is turned ON when peripheral devices are in the test mode:

If "JOG start signal" is turned ON when peripheral devices are in the test mode, the "JOG start signal" will be ignored and inching operation will not be carried out.

Fig. 11.15 Operation when JOG start signal is turned ON in test mode

## 11.4 Manual pulse generator operation

### 11.4.1 Outline of manual pulse generator operation

#### Important

Create the sequence program so that " **Cd.21** Manual pulse generator enable flag" is always set to "0" (disabled) when a manual pulse generator operation is not carried out.

\* Mistakenly touching the manual pulse generator when the manual pulse generator enable flag is set to "1" (enable) can cause accidents or incorrect positioning.

#### Manual pulse generator operation

In manual pulse generator operations, pulses are input to the QD75 from the manual pulse generator. This causes the same No. of input pulses to be output from the QD75 to the servo amplifier, and the workpiece is moved in the designated direction.

The following shows an example of manual pulse generator operation.

|    |                                                                                                                                                            |
|----|------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 1) | When the " <b>Cd.21</b> Manual pulse generator enable flag" is set to "1", the BUSY signal turns ON and the manual pulse generator operation is enabled.   |
| 2) | The workpiece is moved corresponding to the No. of pulses input from the manual pulse generator.                                                           |
| 3) | The workpiece movement stops when no more pulses are input from the manual pulse generator.                                                                |
| 4) | When the " <b>Cd.21</b> Manual pulse generator enable flag" is set to "0", the BUSY signal turns OFF and the manual pulse generator operation is disabled. |

Fig. 11.16 Manual pulse generator operation

**■ Restricted items**

A manual pulse generator is required to carry out manual pulse generator operation.

**■ Precautions during operation**

- (1) The speed during manual pulse generator operation is not limited by the " **Pr.8** Speed limit value".
- (2) If the " **Cd.21** Manual pulse generator enable flag" is turned ON while the QD75 is BUSY (BUSY signal ON), a warning "Start during operation" (warning code: 100) will occur.
- (3) If a stop factor occurs during manual pulse generator operation, the operation will stop, and the BUSY signal will turn OFF.  
At this time, the " **Cd.21** Manual pulse generator enable flag" will be left ON, but manual pulse generator operation will not be possible. To carry out manual pulse generator operation again, measures must be carried out to eliminate the stop factor. Once eliminated, the operation can be carried out again by turning the " **Cd.21** Manual pulse generator enable flag" ON → OFF → ON.  
(Note that this excludes when hardware/software stroke limit errors occurs.)
- (4) Pulses will not be output if an error occurs when the manual pulse generator operation starts.

**REMARK**

- One QD75 module can be connected to one manual pulse generator.
- The QD75 module can simultaneously output pulses to the axis 1 to axis 4 drive units by one manual pulse generator.  
(1- to 4-axis simultaneous operation is possible.)

### Operations when stroke limit error occurs

When the hardware stroke limit error or the software stroke limit error is detected during operation, the operation will decelerate to a stop. However, "Md.26 Axis operation status" will keep the status "Manual pulse generator operation" in that case. \*1

After stopping, manual pulse generator input pulses to the outside direction of the limit range are not accepted, but operation can be executed within the range.

\*1: Only when the current feed value or the current machine feed value overflows or underflows during deceleration, the manual pulse generator operation will terminate as "Md.26 Axis operation status" is changed to "Error". To carry out manual pulse generator operation again, "Cd.21 Manual pulse generator enable flag" must be turned OFF once and turn ON.

### Manual pulse generator operation timing and processing time

The following drawing shows details of the manual pulse generator operation timing and processing time.

Fig. 11.17 Manual pulse generator operation timing and processing times

#### Normal timing times

| Model           | t1         | t2            | t3             | t4             |
|-----------------|------------|---------------|----------------|----------------|
| QD75P□N/QD75D□N | 0 to 0.9ms | 1.7 to 30.2ms | 58.6 to 87.6ms | 28.4 to 57.2ms |
| QD75P□/QD75D□   | 0 to 2.6ms | 6.2 to 32ms   | 60.4 to 90ms   | 28.4 to 57.6ms |

• Delays may occur in the t1 timing time due to the operation status of other axes.

### ■ Position control by manual pulse generator operation

In manual pulse generator operation, the position is moved by a "manual pulse generator 1 pulse movement amount" per pulse.

The current feed value in the positioning control by manual pulse generator operation can be calculated using the expression shown below.

$$\text{Current feed value} = \text{Number of input pulses} \times \boxed{\text{Cd.20}} \text{ Manual pulse generator 1 pulse input magnification} \times \text{Manual pulse generator 1 pulse movement amount}$$

| $\boxed{\text{Pr.1}}$ Unit setting             | mm                | inch        | degree        | pulse  |
|------------------------------------------------|-------------------|-------------|---------------|--------|
| Manual pulse generator 1 pulse movement amount | 0.1 $\mu\text{m}$ | 0.00001inch | 0.00001degree | 1pulse |

For example, when " $\boxed{\text{Pr.1}}$  Unit setting" is mm and " $\boxed{\text{Cd.20}}$  Manual pulse generator 1 pulse input magnification" is 2, and 100 pulses are input from the manual pulse generator, the current feed value is as follows.

$$\begin{aligned} 100 \times 2 \times 0.1 &= 20 [\mu\text{m}] \\ &= 200 [\text{Current feed value}] \end{aligned}$$

The number of pulses output actually to the drive unit is "Manual pulse generator 1 pulse movement amount/movement amount per pulse \*". For example, when " $\boxed{\text{Pr.1}}$  Unit setting" is mm and the movement amount per pulse is 1  $\mu\text{m}$ ,  $0.1/1 = 1/10$ , i.e., the output to the drive unit per pulse from the manual pulse generator is 1/10 pulse. Thus, the QD75 outputs 1 pulse to the drive unit after receiving 10 pulses from the manual pulse generator.

$$* \text{ Movement amount per pulse} = \frac{\boxed{\text{Pr.3}} \text{ Movement amount per rotation}}{\boxed{\text{Pr.2}} \text{ No. of pulses per rotation}} \times \boxed{\text{Pr.4}} \text{ Unit magnification}$$

### ■ Speed control by manual pulse generation operation

The speed during positioning control by manual pulse generator operation is a speed corresponding to the No. of input pulses per unit time, and can be obtained using the following equation.

$$\text{Output command frequency} = \text{Input frequency} \times \boxed{\text{Cd.20}} \text{ Manual pulse generator 1 pulse input magnification}$$

## 11.4.2 Manual pulse generator operation execution procedure

The manual pulse generator operation is carried out by the following procedure.

**REMARK**

- Mechanical elements such as limit switches are considered as already installed.
- Parameter settings work in common for all control using the QD75.

## 11.4.3 Setting the required parameters for manual pulse generator operation

The "Parameters" must be set to carry out manual pulse generator operation.

The following table shows the setting items of the required parameters for carrying out manual pulse generator operation. When only manual pulse generator operation will be carried out, no parameters other than those shown below need to be set. (Use the initial values or setting values within a range where no error occurs for trouble-free operation.)

| Setting item |                                                                    | Setting requirement | Factory-set initial value<br>(setting details)          |
|--------------|--------------------------------------------------------------------|---------------------|---------------------------------------------------------|
| Parameters   | <b>Pr.1</b> Unit setting                                           | ◎                   | 3 (pulse)                                               |
|              | <b>Pr.2</b> No. of pulses per rotation (Ap) (Unit: pulse)          | ◎                   | 20000                                                   |
|              | <b>Pr.3</b> Movement amount per rotation (Al) (Unit: pulse)        | ◎                   | 20000                                                   |
|              | <b>Pr.4</b> Unit magnification (Am)                                | ◎                   | 1 (1-fold)                                              |
|              | <b>Pr.5</b> Pulse output mode                                      | ◎                   | 1 (CW/CCW mode)                                         |
|              | <b>Pr.6</b> Rotation direction setting                             | ◎                   | 0 (current value increases by forward run pulse output) |
|              | <b>Pr.11</b> Backlash compensation amount (Unit: pulse)            | ○                   | 0                                                       |
|              | <b>Pr.12</b> Software stroke limit upper limit value (Unit: pulse) | ○                   | 2147483647                                              |
|              | <b>Pr.13</b> Software stroke limit lower limit value (Unit: pulse) | ○                   | -2147483648                                             |
|              | <b>Pr.14</b> Software stroke limit selection                       | ○                   | 0 (current feed value)                                  |
|              | <b>Pr.15</b> Software stroke limit valid/invalid setting           | ○                   | 0 (valid)                                               |
|              | <b>Pr.17</b> Torque limit setting value (Unit: %)                  | ○                   | 300                                                     |
|              | <b>Pr.22</b> Input signal logic selection                          | ○                   | 0 (Manual pulse generator input is negative logic.)     |
|              | <b>Pr.23</b> Output signal logic selection                         | ○                   | 0 (Pulse output to drive unit is negative logic.)       |
|              | <b>Pr.24</b> Manual pulse generator input selection                | ○                   | 0 (4 times multiplication of A phase/B phase)           |

◎ : Setting always required.

○ : Set according to requirements (Leave set to the initial value when not used.)

|        |
|--------|
| REMARK |
|--------|

- Parameter settings work in common for all control using the QD75. When carrying out other control ("major positioning control", "high-level positioning control", "OPR positioning control"), the respective setting items must also be matched and set.
- Parameters are set for each axis. But **Pr.22** Manual pulse generator input logic (b8), **Pr.24** is set only for axis 1. (The setting for axes 2,3, and 4 is ignored.)
- Refer to CHAPTER 5 "DATA USED FOR POSITIONING CONTROL" for setting details.

#### 11.4.4 Creating a program to enable/disable the manual pulse generator operation

A sequence program must be created to execute a manual pulse generator operation. Consider the "required control data setting", "start conditions" and "start time chart" when creating the program.

The following shows an example when a manual pulse generator operation is started for axis 1.

##### ■ Required control data setting

The control data shown below must be set to execute a manual pulse generator operation. The setting is carried out with the sequence program.

| Setting item |                                                    | Setting value | Setting details                                                                                                                                                | Buffer memory address |              |              |              |
|--------------|----------------------------------------------------|---------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------|-----------------------|--------------|--------------|--------------|
|              |                                                    |               |                                                                                                                                                                | Axis 1                | Axis 2       | Axis 3       | Axis 4       |
| <b>Cd.20</b> | Manual pulse generator 1 pulse input magnification | 1             | Set the manual pulse generator 1 pulse input magnification.<br>(QD75P□N/QD75D□N: 1 to 1000 times<br>QD75P□/QD75D□: 1 to 100 times)                             | 1522<br>1523          | 1622<br>1623 | 1722<br>1723 | 1822<br>1823 |
| <b>Cd.21</b> | Manual pulse generator enable flag                 | 1 (0)         | Set "1: Enable manual pulse generator operation". (Set "0: Disable manual pulse generator operation" when finished with the manual pulse generator operation.) | 1524                  | 1624         | 1724         | 1824         |

\* Refer to Section 5.7 "List of control data" for details on the setting details.

##### ■ Start conditions

The following conditions must be fulfilled when starting. The required conditions must also be assembled in the sequence program, and the sequence program must be configured so the operation will not start if the conditions are not fulfilled.

| Signal name      |                         | Signal state |                                               | Device |        |        |        |
|------------------|-------------------------|--------------|-----------------------------------------------|--------|--------|--------|--------|
|                  |                         |              |                                               | Axis 1 | Axis 2 | Axis 3 | Axis 4 |

|                  | QD75 READY signal       | ON           | QD75 preparation completed                    | X0     |        |        |        |
|                  | Synchronization flag *  | ON           | QD75 buffer memory<br>The access is possible. | X1     |        |        |        |
|                  | Axis stop signal        | OFF          | Axis stop signal is OFF                       | Y4     | Y5     | Y6     | Y7     |
|                  | Start complete signal   | OFF          | Start complete signal is OFF                  | X10    | X11    | X12    | X13    |
|                  | BUSY signal             | OFF          | QD75 is not operating                         | XC     | XD     | XE     | XF     |
|                  | Error detection signal  | OFF          | There is no error                             | X8     | X9     | XA     | XB     |
| External signal  | M code ON signal        | OFF          | M code ON signal is OFF                       | X4     | X5     | X6     | X7     |
|                  | Drive unit READY signal | ON           | Drive unit preparation completed              | —      |        |        |        |
|                  | Stop signal             | OFF          | Stop signal is OFF                            | —      |        |        |        |
|                  | Upper limit (FLS)       | ON           | Within limit range                            | —      |        |        |        |
|                  | Lower limit (RLS)       | ON           | Within limit range                            | —      |        |        |        |

\* If the CPU module is set to the asynchronous mode in the synchronization setting, this must be inserted in the program for interlocking. If it is set to the synchronous mode, it must not be inserted in the program for interlocking because it is turned ON when the CPU module executes calculation.

■ Start time chart

■ Creating the program

# CHAPTER 12 CONTROL SUB FUNCTIONS

The details and usage of the "sub functions" added and used in combination with the main functions are explained in this chapter.

A variety of sub functions are available, including functions specifically for machine OPR and generally related functions such as control compensation, etc. More appropriate, finer control can be carried out by using these sub functions. Each sub function is used together with a main function by creating matching parameter settings and sequence programs. Read the execution procedures and settings for each sub function, and set as required.

|        |                                                              |        |
|--------|--------------------------------------------------------------|--------|
| 12.1   | Outline of sub functions .....                               | 12- 2  |
| 12.1.1 | Outline of sub functions .....                               | 12- 2  |
| 12.2   | Sub functions specifically for machine OPR .....             | 12- 4  |
| 12.2.1 | OPR retry function .....                                     | 12- 4  |
| 12.2.2 | OP shift function .....                                      | 12- 8  |
| 12.3   | Functions for compensating the control .....                 | 12- 12 |
| 12.3.1 | Backlash compensation function .....                         | 12- 12 |
| 12.3.2 | Electronic gear function .....                               | 12- 14 |
| 12.3.3 | Near pass function .....                                     | 12- 21 |
| 12.3.4 | Output timing selection of near pass control .....           | 12- 23 |
| 12.4   | Functions to limit the control .....                         | 12- 27 |
| 12.4.1 | Speed limit function .....                                   | 12- 27 |
| 12.4.2 | Torque limit function .....                                  | 12- 29 |
| 12.4.3 | Software stroke limit function .....                         | 12- 33 |
| 12.4.4 | Hardware stroke limit function .....                         | 12- 39 |
| 12.5   | Functions to change the control details .....                | 12- 41 |
| 12.5.1 | Speed change function .....                                  | 12- 41 |
| 12.5.2 | Override function .....                                      | 12- 48 |
| 12.5.3 | Acceleration/deceleration time change function .....         | 12- 51 |
| 12.5.4 | Torque change function .....                                 | 12- 56 |
| 12.5.5 | Target position change function .....                        | 12- 58 |
| 12.6   | Absolute position restoration function .....                 | 12- 62 |
| 12.7   | Other functions .....                                        | 12- 73 |
| 12.7.1 | Step function .....                                          | 12- 73 |
| 12.7.2 | Skip function .....                                          | 12- 78 |
| 12.7.3 | M code output function .....                                 | 12- 81 |
| 12.7.4 | Teaching function .....                                      | 12- 86 |
| 12.7.5 | Command in-position function .....                           | 12- 93 |
| 12.7.6 | Acceleration/deceleration processing function .....          | 12- 96 |
| 12.7.7 | Pre-reading start function .....                             | 12- 99 |
| 12.7.8 | Deceleration start flag function .....                       | 12-104 |
| 12.7.9 | Stop command processing for deceleration stop function ..... | 12-108 |

## 12.1 Outline of sub functions

"Sub functions" are functions that compensate, limit, add functions, etc., to the control when the main functions are executed. These sub functions are executed by parameter settings, commands from GX Configurator-QP, sub function sequence programs, etc.

## 12.1.1 Outline of sub functions

The following table shows the types of sub functions available.

| Sub function                               |                                                | Details                                                                                                                                                                                                                                                                                   |
|--------------------------------------------|------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Sub functions specifically for machine OPR | OPR retry function                             | This function retries the machine OPR with the upper/lower limit switches during machine OPR. This allows machine OPR to be carried out even if the axis is not returned to before the near-point dog with JOG operation, etc.                                                            |
|                                            | OP shift function                              | After returning to the machine OP, this function offsets the position by the designated distance from the machine OP position and sets that position as the OP address.                                                                                                                   |
| Functions for compensating the control     | Backlash compensation function                 | This function compensates the mechanical backlash. Feed pulses equivalent to the set backlash amount are output each time the movement direction changes.                                                                                                                                 |
|                                            | Electronic gear function                       | By setting the movement amount per pulse, this function can freely change the machine movement amount per commanded pulse.<br>A flexible positioning system that matches the machine system can be structured with this function.                                                         |
|                                            | Near pass function * 1                         | This function suppresses the machine vibration when the positioning data is switched during continuous path control in the interpolation control.                                                                                                                                         |
|                                            | Output timing selection of near pass control   | This function allows the user to select the timing to output the difference ( $\Delta \ell$ ) between the actual and the set positioning end addresses in continuous path control, in which the difference ( $\Delta \ell$ ) is output during the execution of the next positioning data. |
| Functions to limit the control             | Speed limit function                           | If the command speed exceeds " [Pr.8] Speed limit value" during control, this function limits the commanded speed to within the " [Pr.8] Speed limit value" setting range.                                                                                                                |
|                                            | Torque limit function * 2                      | If the torque generated by the servomotor exceeds " [Pr.17] Torque limit setting value" during control, this function limits the generated torque to within the " [Pr.17] Torque limit setting value" setting range.                                                                      |
|                                            | Software stroke limit function                 | If a command outside of the upper/lower limit stroke limit setting range, set in the parameters, is issued, this function will not execute positioning for that command.                                                                                                                  |
|                                            | Hardware stroke limit function                 | This function carries out deceleration stop with the limit switch connected to the QD75 external device connector.                                                                                                                                                                        |
| Functions to change the control details    | Speed change function                          | This function changes the speed during positioning.<br>Set the changed speed in the speed change buffer memory ( [Cd.14] New speed value), and change the speed with the speed change request ( [Cd.15] Speed change request).                                                            |
|                                            | Override function                              | This function changes the speed within a percentage of 1 to 300% during positioning. This is executed using " [Cd.13] Positioning operation speed override".                                                                                                                              |
|                                            | Acceleration/deceleration time change function | This function changes the acceleration/deceleration time during speed change. (function added to the speed change function and override function)                                                                                                                                         |
|                                            | Torque change function                         | This function changes the "torque limit value" during control.                                                                                                                                                                                                                            |
|                                            | Target position change function                | This function changes the target position during the execution of positioning. At the same time, this also can change the speed.                                                                                                                                                          |

\* 1 The near pass function is validated only when the machine of the standard specification carries out the position control with the continuous path control mode.

It cannot be invalidated with parameters.

\* 2 To carry out "torque limit", the "D/A conversion module" and a "drive unit capable of the torque limit command with an analog voltage" must be prepared.

| Sub function                               |                                                        | Details                                                                                                                                                                                                                                                                                                                               |
|--------------------------------------------|--------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Absolute position restoration function * 3 |                                                        | This function restores the absolute position of designated axis. By this function, the OPR after power ON from OFF is not required once the OPR is executed when the system operation is started.                                                                                                                                     |
| Other functions                            | Step function                                          | This function temporarily stops the operation to confirm the positioning operation during debugging, etc.<br>The operation can be stopped at each "automatic deceleration" or "positioning data".                                                                                                                                     |
|                                            | Skip function                                          | This function stops the positioning being executed (decelerates to a stop) when the skip signal is input, and carries out the next positioning.                                                                                                                                                                                       |
|                                            | M code output function                                 | This function issues a sub work (clamp or drill stop, tool change, etc.) according to the code No. (0 to 65535) set for each positioning data.                                                                                                                                                                                        |
|                                            | Teaching function                                      | This function stores the address positioned with manual control into the positioning address ([Da.6] Positioning address/movement amount) having the designated positioning data No.                                                                                                                                                  |
|                                            | Command in-position function                           | At each automatic deceleration, this function calculates the remaining distance for the QD75 to reach the positioning stop position, and when the value is less than the set value, sets the "command in-position flag" to 1. When using another sub work before ending the control, use this function as a trigger for the sub work. |
|                                            | Acceleration/deceleration processing function          | This function adjusts the control acceleration/deceleration. (acceleration/deceleration time and curve).                                                                                                                                                                                                                              |
|                                            | Pre-reading start function                             | This function shortens the virtual start time.                                                                                                                                                                                                                                                                                        |
|                                            | Deceleration start flag function                       | Function that turns ON the flag when the constant speed status or acceleration status switches to the deceleration status during position control, whose operation pattern is "Positioning complete", to make the stop timing known.                                                                                                  |
|                                            | Stop command processing for deceleration stop function | Function that selects a deceleration curve when a stop cause occurs during deceleration stop processing to speed 0.                                                                                                                                                                                                                   |

\* 3 To execute the "absolute position restoration function", the following are required: "16-point input module"; "16-point output module"; and "drive unit capable of configuring an absolute position detection system, which is a Mitsubishi Electric General-Purpose AC Servo having an absolute position detection function (absolute position data transference protocol) equivalent to that of MR-J3-□A".

## 12.2 Sub functions specifically for machine OPR

The sub functions specifically for machine OPR include the "OPR retry function" and "OP shift function". Each function is executed by parameter setting.

### 12.2.1 OPR retry function

When the workpiece goes past the OP without stopping during positioning control, it may not move back in the direction of the OP although a machine OPR is commanded, depending on the workpiece position. This normally means the workpiece has to be moved to a position before the near-point dog by a JOG operation, etc., to start the machine OPR again. However, by using the OPR retry function, a machine OPR can be carried out regardless of the workpiece position.

The details shown below explain about the "OPR retry function".

- [1] Control details
- [2] Control Precautions
- [3] Setting method

#### [1] Control details

The following drawing shows the operation of the OPR retry function.

- (1) OPR retry point return retry operation when the workpiece is within the range between the upper/lower limits.

Fig. 12.1 OPR retry operation by limit signal detection

- (2) OPR retry operation when the workpiece is outside the range between the upper/lower limits.

(a) When the direction from the workpiece to the OP is the same as the "Pr.44 OPR direction", a normal machine OPR is carried out.

(b) When the direction from the workpiece to the OP is the opposite direction from the "Pr.44 OPR direction", the operation carries out a deceleration stop when the near-point dog turns OFF, and then carries out a machine OPR in the direction set in "Pr.44 OPR direction".

Note) The above figures in (a) and (b) are examples where "Pr.44 OPR direction" is set to "0: Positive direction". When "0: Positive direction" is set in Pr.44, check that the limit switch placed in the OPR direction acts as the upper limit. When "1: Negative direction" is set in Pr.44, check that the limit switch placed in the OPR direction acts as the lower limit. Incorrect wiring of these limit switches may cause improper OPR retry operation. If any malfunction is identified, check and correct "Pr.6 Rotation direction setting" and the wiring.

Fig. 12.2 OPR retry operation from on limit (limit switch OFF)

## (3) Setting the dwell time during an OPR retry

The OPR retry function can perform such function as the dwell time using "Pr.57 Dwell time at OPR retry" when the reverse run operation is carried out due to detection by the limit signal for upper/lower limits and when the machine OPR is executed after the near point dog is turned OFF to stop the operation.

"Pr.57 Dwell time during OPR" is validated when the operation stops at the "A" and "B" positions in the following drawing. (The dwell time is the same value at both positions "A" and "B".)

Fig. 12.3 Setting the dwell time during an OPR retry

## [2] Control Precautions

- (1) The following table shows whether the OPR retry function may be executed by the " **Pr.43** OPR method".

| <b>Pr.43</b> OPR method | Execution status of OPR retry function |
|-------------------------|----------------------------------------|
| Near-point dog method   | ○ : Execution possible                 |
| Stopper method 1)       | ○ : Execution possible * 1             |
| Stopper method 2)       | ○ : Execution possible * 1             |
| Stopper method 3)       | × : Execution not possible             |
| Count method 1)         | ○ : Execution possible                 |
| Count method 2)         | ○ : Execution possible                 |

\* 1 Starting can be executed from the position of the limit switch installed in the opposition direction of " **Pr.44** OPR direction". (The limit signal is OFF.) However, the retry operation by the limit switch in the OPR direction cannot be executed since a stopper is installed in the OPR direction.

- (2) Always establish upper/lower limit switches at the upper/lower limit positions of the machine, and connect them to the QD75. If the OPR retry function is used without hardware stroke limit switches, the motor will continue rotation until a hardware stroke limit signal is detected.
- (3) Do not configure a system so that the drive unit power turns OFF by the upper/lower limit switches connected to the QD75. If the drive unit power is turned OFF, the OPR retry cannot be carried out.

## [3] Setting method

To use the "OPR retry function", set the required details in the parameters shown in the following table, and write them to the QD75.

When the parameters are set, the OPR retry function will be added to the machine OPR control. The set details are validated at the rising edge (OFF → ON) of the PLC READY signal (Y0). (Set " **Pr.57** Dwell time during OPR retry" according to the user's requirements.)

| Setting item                             | Setting value | Setting details                                                                          | Factory-set initial value |
|------------------------------------------|---------------|------------------------------------------------------------------------------------------|---------------------------|
| <b>Pr.48</b> OPR retry                   | 1             | Set "1: Carry out OPR retry by limit switch".                                            | 0                         |
| <b>Pr.57</b> Dwell time during OPR retry | →             | Set the deceleration stop time during OPR retry. (Random value between 0 and 65535 (ms)) | 0                         |

\* Refer to Section 5.2 "List of parameters" for setting details.

**REMARK**

- Parameters are set for each axis.
- It is recommended that the parameters be set whenever possible with GX Configurator-QP. Execution by sequence program uses many sequence programs and devices. The execution becomes complicated, and the scan times will increase.

## 12.2.2 OP shift function

When a machine OPR is carried out, the OP is normally established using the near-point dog, stopper, and zero signal. However, by using the OP shift function, the machine can be moved a designated movement amount from the position where the zero signal was detected. A mechanically established OP can then be interpreted at that point.

The OP shift function can be used without relation to " **Pr.43** OPR method".

The details shown below explain about the "OP shift function".

- [1] Control details
- [2] Setting range for the OP shift amount
- [3] Movement speed during OP shift
- [4] Control Precautions
- [5] Setting method

## [1] Control details

The following drawing shows the operation of the OP shift function.

Fig. 12.4 OP shift operation

### [2] Setting range for the OP shift amount

Set the OP shift amount within the range from the detected zero signal to the upper/lower limit switches.

Fig. 12.5 Setting range for the OP shift amount

### [3] Movement speed during OP shift

When using the OP shift function, the movement speed during the OP shift is set in "Pr.56 Speed designation during OP shift". The movement speed during the OP shift is selected from either the "Pr.46 OPR speed" or the "Pr.47 Creep speed".

The following drawings show the movement speed during the OP shift when a mechanical OPR is carried out by the near-point dog method.

(1) OP shift operation at the "Pr.46 OPR speed"

(When "Pr.56 Speed designation during OP shift" is 0)

Fig. 12.6 OP shift operation at the OPR speed

- (2) OP shift operation at the " **Pr.47** Creep speed"  
(When " **Pr.56** Speed designation during OP shift" is 1)

Fig. 12.7 OP shift operation at the creep speed

#### [4] Control Precautions

- (1) The following data are set after the OP shift amount is complete.
  - OPR complete flag (" **Md.31** Status: b4)
  - **Md.20** Current feed value
  - **Md.21** Machine feed value
  - **Md.26** Axis operation status
 OPR request flag (**Md.31** Status: b3) is reset after completion of the OP shift.
- (2) " **Pr.53** OP shift amount" is not added to " **Md.34** Movement amount after near-point dog ON". The movement amount immediately before the OP shift operation, considering near-point dog ON as "0", is stored. For the stopper method (1) 2) 3)), the movement amount is not changed from "0".
- (3) When using the OP shift function with the stopper method (1) 2) 3)) selected for the OPR method, configure the OP shift operation in the opposite direction of the OPR direction.  
It cannot shift to the OPR direction due to a mechanical stopper in the OPR direction.

#### [5] Setting method

To use the "OP shift function", set the required details in the parameters shown in the following table, and write them to the QD75.

When the parameters are set, the OP shift function will be added to the machine OPR control. The set details are validated at the rising edge (OFF → ON) of the PLC READY signal (Y0).

| Setting item                                   | Setting value | Setting details                                                                                  | Factory-set initial value |
|------------------------------------------------|---------------|--------------------------------------------------------------------------------------------------|---------------------------|
| <b>Pr.53</b> OP shift amount                   | →             | Set the shift amount during the OP shift.                                                        | 0                         |
| <b>Pr.56</b> Speed designation during OP shift | →             | Select the speed during the OP shift<br>0: <b>Pr.46</b> OPR speed<br>1: <b>Pr.47</b> Creep speed | 0                         |

\* Refer to Section 5.2 "List of parameters" for setting details.

|        |
|--------|
| REMARK |
|--------|

- Parameters are set for each axis.
- It is recommended that the parameters be set whenever possible with GX Configurator-QP. Execution by sequence program uses many sequence programs and devices. The execution becomes complicated, and the scan times will increase.

### 12.3 Functions for compensating the control

The sub functions for compensating the control include the "backlash compensation function", "electronic gear function", "near pass function", and "output timing selection of near pass control". Each function is executed by parameter setting or sequence program creation and writing.

#### 12.3.1 Backlash compensation function

The "backlash compensation function" compensates the backlash amount in the mechanical system. When the backlash compensation amount is set, an extra amount of pulses equivalent to the set backlash amount is output every time the movement direction changes.

The details shown below explain about the "backlash compensation function".

- [1] Control details
- [2] Control Precautions
- [3] Setting method

##### [1] Control details

The following drawing shows the operation of the backlash compensation function.

Fig. 12.8 Backlash compensation amount

## [2] Control Precautions

- (1) The feed pulses of the backlash compensation amount are not added to the " [Md.20] Current feed value" or " [Md.21] Machine feed value".
- (2) Always carry out a machine OPR before starting the control when using the backlash compensation function (when " [Pr.11] Backlash compensation amount" is set). The backlash in the mechanical system cannot be correctly compensated if a machine OPR is not carried out.
- (3) Set the No. of pulses output in one backlash compensation (value in which the " [Pr.11] Backlash compensation amount" is divided by the "movement amount per pulse") to a value of 255 or lower. An error "Backlash compensation amount error" (error code: 920) will occur if a value over 255 is set. (Depending on the connected servo, tracking may not be possible if a large amount of pulses is output at once.)

$$0 \leq \frac{\text{Backlash compensation amount}}{\text{Movement amount per pulse}} \leq 255$$

(Omit values after the decimal point.)

- (4) Backlash compensation, which includes the movement amount and " [Pr.11] Backlash compensation amount", is output the moment at the moving direction changes.
- (5) Backlash compensation cannot be made when the stepping motor is used. The backlash compensation function cannot be used for an axis where a stepping motor is connected. Set 0 (initial value) in " [Pr.11] Backlash compensation amount".

## [3] Setting method

To use the "backlash compensation function", set the "backlash compensation amount" in the parameter shown in the following table, and write it to the QD75. The set details are validated at the rising edge (OFF → ON) of the PLC READY signal (Y0).

| Setting item |                              | Setting value | Setting details                       | Factory-set initial value |
|--------------|------------------------------|---------------|---------------------------------------|---------------------------|
| [Pr.11]      | Backlash compensation amount | →             | Set the backlash compensation amount. | 0                         |

\* Refer to Section 5.2 "List of parameters" for setting details.

## REMARK

- Parameters are set for each axis.
- It is recommended that the parameters be set whenever possible with GX Configurator-QP. Execution by sequence program uses many sequence programs and devices. The execution becomes complicated, and the scan times will increase.

### 12.3.2 Electronic gear function

The "electronic gear function" adjusts the pulses calculated and output according to the parameters set in the QD75 with the actual machine movement amount.

The "electronic gear function" has the following four functions.

- [A] The function converts the command value (speed, movement amount from the start point to the end point), which is set in mm units, to pulse units, and determines the pulse frequency and pulse number of the command pulse.

Fig. 12.9 Conversion to pulse units

\* 1: Unit specified with " Pr.1 Unit setting" (mm, inch, degree, pulse)

- [B] If values less than one pulse are generated by converting the movement amount from the start point to the end point to pulse units, the values are not output and the machine stops at the front side of the positioning direction. The function accumulates values less than one pulse that could not be pulse output in the QD75 and outputs one pulse when the total cumulative value reached one pulse or more.
- [C] When machine OPR is completed, current value changing is completed, speed control is started (except when current feed value change is present), or fixed-feed control is started, the function clears to "0" the cumulative values of less than one pulse which could not be output. (If the cumulative value is cleared, an error will occur by a cleared amount in the feed machine value. Control can be constantly carried out at the same machine movement amount, even when the fixed-feed control is continued.)
- [D] The function compensates the mechanical system error of the command movement amount and actual movement amount by adjusting the "movement amount per pulse".  
 (The "movement amount per pulse" value is defined by " Pr.2 No. of pulses per rotation (Ap)", " Pr.3 Movement amount per rotation (Al)", and " Pr.4 Unit magnification (Am)".)

The QD75 automatically carries out the processing for [A] and [C].

The details shown below explain about the "electronic gear function", including the method for compensating the error in [D] above, etc.

- [1] Movement amount per pulse
- [2] Error compensation method
- [3] Control Precautions

### [1] Movement amount per pulse

" [Pr.2] No. of pulses per rotation (Ap)", " [Pr.3] Movement amount per rotation (Al)", and " [Pr.4] Unit magnification (Am)" are the items for determining how many rotations (equivalent to how many pulses) a motor should operate to move a machine for movement amount set in a program.

The drive unit controls the motor with the pulse number.

The following shows the details of control of the QD75.

Fig. 12.10 System using a ball screw

\*1: The upper limits of the command pulse frequency are as follows

- QD75D□N : 4Mpulse/s
- QD75D□ : 1Mpulse/s
- QD75P□N/QD75P□ : 200kpulse/s

\*2: For a drive unit without electronic gear function, or when not using electronic gear function, this value is 1 (single).

Consider a system with the motor connected to a ball screw, such as the figure above.

1 is set to the electronic gear of the drive unit.

The movement amount of the machine is in mm or inch unit. Set the command value in mm or inch units to the QD75 for the CPU module program.

The motor is controlled by the drive unit in pulse number units.

Consequently, since the command value in mm or inch units is converted to pulse units, set Ap, Al, and Am so that the following relational expressions are satisfied.

$$\begin{aligned} \text{Number of pulses per rotation of motor} &= A_p \\ \text{Movement amount per rotation of motor} &= A_l \times A_m \end{aligned}$$

In this case, the machine movement amount for the command 1 pulse output from the QD75 is calculated by the following expression.

$$\text{Movement amount per pulse (A)} = \frac{A_l \times A_m}{A_p}$$

| POINT                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <p>The command frequency from the QD75 is limited by a ceiling. If the command frequency exceeds the upper limit, increase the "Movement amount per pulse (A)" greater (N times) to decrease the command frequency.</p> <p>In this case, the electronic gear on the drive unit must be increased by N times as well.</p> <p>The command pulse from the QD75 is changes to 1/N times. Therefore, multiply it by N on the drive unit side to keep the number of motor rotations.</p> <p>Since the "movement amount per pulse (A)" is increased, the position accuracy (command resolution) for the command 1 pulse from the QD75 decreases.</p> <p>Consider to decrease the command speed when the position accuracy is required.</p> |

### (1) Setting range of Ap, Al, Am

Determined setting ranges are available for Ap, Al, and Am. The following shows the setting ranges.

| Setting item |                                   | Setting range |                                |
|--------------|-----------------------------------|---------------|--------------------------------|
| Pr.2         | No. of pulses per rotation (Ap)   | 1 to 65535    |                                |
| Pr.3         | Movement amount per rotation (Al) | 1 to 65535    | $\times 10^{-1} \mu\text{m}$   |
|              |                                   |               | $\times 10^{-5} \text{inch}$   |
|              |                                   |               | $\times 10^{-5} \text{degree}$ |
|              |                                   |               | pulse                          |
| Pr.4         | Unit magnification (Am)           | 1/10/100/1000 |                                |

For details of the setting, refer to Section 5.2 "List of parameters". In addition, use the value set in " Pr.3 Movement amount per rotation (Al)" as movement amount per rotation (Al) to calculate movement amount per pulse (A).

Example: Movement amount per pulse (A) when " Pr.1 Unit setting" is "0: mm"

" Pr.2 No. of pulses per rotation": 20000

" Pr.3 Movement amount per rotation": 40000

" Pr.4 Unit magnification": 1

$$\text{Movement amount per pulse (A)} = \frac{40000 \times 10^{-1}}{20000} \times 1 = 0.2 \mu\text{m}$$

If the value is beyond the setting range, setting values of each parameter can be decreased by canceling the numerator and denominator with the movement amount per pulse (A) kept.

## [2] Error compensation method

When position control is carried out by the "movement amount per pulse" set in the QD75 parameters, an error sometimes occurs between the command movement amount (L) and the actual movement amount (L').

That error is compensated in the QD75 by adjusting the values in " [Pr.2] No. of pulses per rotation (Ap)", " [Pr.3] Movement amount per rotation (Al)", and " [Pr.4] Unit magnification (Am)". (When " [Pr.1] Unit setting" is "0: mm")

### (1) Definition

The "error compensation amount" used to carry out the error compensation is defined as follows.

$$\text{Error compensation amount} = \frac{\text{Actual movement amount (L')}}{\text{Designated movement amount (L)}}$$

The QD75 "movement amount per pulse" is calculated with the following equation.

Movement amount per pulse is "A", " [Pr.2] No. of pulses per rotation" is (Ap), " [Pr.3] Movement amount per rotation" is (Al), and " [Pr.4] Unit magnification" is (Am).

$$A = \frac{Al}{Ap} \times Am$$

### (2) Procedure

- (a) Set the "command movement amount (L)", and carry out positioning. (Set the "movement amount per pulse (A)" according to Section 5.2 "List of parameters".)
- (b) After positioning, measure the "actual movement amount (L)'".
- (c) Calculate the "error compensation amount".

$$\text{Error compensation amount} = \frac{L'}{L}$$

- (d) Calculate the post-compensation " [Pr.2] No. of pulses per rotation (Ap')", " [Pr.3] Movement amount per rotation (Al')", and " [Pr.4] Unit magnification (Am')" from the "post-compensation movement amount per pulse (A)'".

$$\begin{aligned} A &= A \times \text{Error compensation amount} \\ &= \frac{Al}{Ap} \times Am \times \frac{L'}{L} \\ &= \frac{Al'}{Ap'} \times Am' \end{aligned}$$

(Adjust with Am' so that Al' and Ap' do not exceed the setting range.)

|                                                                                                                                       |                                                                                                |

\* Refer to Section 5.2 "List of parameters" for setting details.

### [3] Control Precautions

If values less than one pulse are generated by converting the movement amount from the start point to the end point to pulse units with the electronic gear function, the values are not output and the machine stops at the front side of the positioning direction. The function accumulates values less than one pulse that could not be pulse output in the QD75 and outputs one pulse when the total cumulative value reached one pulse or more.

Fig. 12.11 Operation when values less than one pulse are generated

To prevent values less than one pulse from being generated, set the positioning address so that the value, calculated by multiplying the inverse number of movement amount per pulse (A) to the movement amount to the end point, becomes an integer.

It is recommended that the "movement amount per pulse (A)" be set to a value close to "1" for the following reasons. The "movement amount per pulse" of "1" means the minimum value in each " Pr.1 Unit setting". (0.1 [μm] for the unit [mm])

- (1) When the setting of the movement amount per pulse is decreased, the command frequency may increase. Be careful when changing the setting.
- (2) If the setting of the movement amount per pulse is less than 1, the mechanical system may oscillate. Be sure to use the movement amount per pulse among the range indicated below.

$$\text{Movement amount per pulse (A)} \geq \frac{1}{500}$$

If the mechanical system oscillates, also use the electronic gear function of the drive unit and the movement amount per pulse greater.

- (3) Set the movement amount per pulse so that the pulse output frequency for the drive unit becomes a value in the following table.

|                                       | QD75P□N/QD75P□      | QD75D□N           | QD75D□            |
|---------------------------------------|---------------------|-------------------|-------------------|
| Pulse output frequency for drive unit | 200kpulse/s or less | 4Mpulse/s or less | 1Mpulse/s or less |

If the setting of pulse output frequency for the drive unit exceeds a value in the table, the QD75 may not operate correctly.

**REMARK**

In the QD75, the general term for the functions in this section is defined as the "electronic gear function". Refer to the User's Manual for the servomotor for the definition of the "electronic gear" on the servomotor side.

### 12.3.3 Near pass function

When continuous pass control is carried out using interpolation control, the near pass function is carried out.

The "near pass function" is a function to suppress the mechanical vibration occurring at the time of switching the positioning data when continuous pass control is carried out using interpolation control.

#### [Near pass function]

The extra movement amount occurring at the end of each positioning data unit being continuously executed is carried over to the next positioning data unit. Alignment is not carried out, and thus the output speed drops are eliminated, and the mechanical vibration occurring during speed changes can be suppressed. Because alignment is not carried out, the operation is controlled on a path that passes near the position set in " Da.6 Positioning address/movement amount".

The details shown below explain about the "near pass function".

#### [1] Control details

#### [2] Control Precautions

#### [1] Control details

The following drawing shows the path of the continuous path control by the 2-axis linear interpolation control.

Fig. 12.12 The path of the continuous path control

## [2] Control Precautions

- (1) If the movement amount designated by the positioning data is small when the continuous path control is executed, the output speed may not reach the designated speed.
- (2) The movement direction is not checked during interpolation operation. Therefore, a deceleration stops are not carried out even the movement direction changes. (See below) For this reason, the output will suddenly reverse when the reference axis movement direction changes. To prevent the sudden output reversal, assign not the continuous path control "11", but the continuous positioning control "01" to the positioning data of the passing point.

Fig. 12.13 Path and output speed of various axes when movement direction varies during continuous path control

### 12.3.4 Output timing selection of near pass control

The function "output timing selection of near pass control" allows the user to select the timing to output the difference ( $\Delta \ell$ ) between the actual and the set positioning end addresses in continuous path control, in which the difference ( $\Delta \ell$ ) is output during the execution of the next positioning data.

The details shown below explain about the function "output timing selection of near pass control".

- [1] Control details
- [2] Control precautions
- [3] Setting method

#### [1] Control details

There are two options for an output timing of near pass control: "At constant speed" and "At deceleration".

- At constant speed: The distance  $\Delta \ell$  is output when the next positioning data is executed in constant speed.
- At deceleration: The distance  $\Delta \ell$  is output when the next positioning speed decelerates from V1 to V2.

When "At constant speed" is selected in a condition where the specified speed of positioning data No.1 and No.2 in the figure 12.14 are "V1 > V2", the distance  $\Delta \ell$  is output when the next positioning data is executed in constant speed; therefore, the positioning execution time is extended.

When "At deceleration" is selected, the positioning execution time is not extended and remains the same as it was set.

The following drawing shows the operation of the function "output timing selection of near pass control".

Fig. 12.14 Acceleration and deceleration depending on the output timing selection of near pass control

## [2] Control precautions

When command speed  $V1$  and  $V2$  are in the condition 1) or 2) below, the command output is that of "At constant speed" even though "At deceleration" was selected.

1) When " $V1 \leq V2$ "

2) When " $(\text{Speed value converted from distance } \Delta \ell)^{*1} \leq V2 < V1$ "

\*1: The height of the grey area in the graph on the bottom right

Fig. 12.15 Examples of when the command output is that of "At constant speed" even though "At deceleration" was selected

## [3] Setting method

To use the function "output timing selection of near pass control", set the following control data in a sequence program.

The set detail is validated at the rising edge (OFF → ON) of the PLC READY signal (Y0).

| Setting item |                                              | Setting value | Setting details                                                                                                                                                                                                                                                                                        | Buffer memory address |

\* Refer to Section 5.7 "List of control data" for setting details.

## 12.4 Functions to limit the control

Functions to limit the control include the "speed limit function", "torque limit function", "software stroke limit", and "hardware stroke limit". Each function is executed by parameter setting or sequence program creation and writing.

### 12.4.1 Speed limit function

The "speed limit function" limits the command speed to a value within the "speed limit value" setting range when the command speed during control exceeds the "speed limit value".

The details shown below explain about the "speed limit function".

[1] Relation between the speed limit function and various controls

[2] Control precautions

[3] Setting method

#### [1] Relation between the speed limit function and various controls

The following table shows the relation of the "speed limit function" and various controls.

| Control type              |                                                                    |                                                 | Speed limit function | Speed limit value             |

|                           | Manual pulse generator operation                                   |                                                 | —                    | Setting is invalid            |

⊙ : Always set

— : Setting not required (Setting value is invalid. Use the initial values or setting values within a range where no error occurs.)

## [2] Control precautions

- If any axis exceeds "[Pr.8] Speed limit value" during 2- to 4-axis speed control, the axis in excess of the speed limit value is controlled at the speed limit value. For the other axes which perform interpolation, the speed can be suppressed by the ratio of a command speed.
- If any axis exceeds "[Pr.8] Speed limit value" during 2- to 4-axis linear interpolation control, 2- to 4-axis fixed-feed control, 2-axis circular interpolation control, or 3-axis helical interpolation control, the axis exceeding the speed limit value is controlled at the speed limit value. For the other axes performing interpolation, the speed can be suppressed by the ratio of a movement distance.
- In 2- to 4-axis linear interpolation control or 2- to 4-axis fixed-feed control, the speed limit value for the interpolation axis may not function under the following condition: "1: Reference axis speed" is set in "[Pr.20] Interpolation speed designation method" or "[Da.29] Interpolation speed designation method", and the reference axis is the minor axis and the interpolation axis is the major axis.
- In 3-axis helical interpolation control, control the composite speed of the circular interpolation axis or the speed of the linear interpolation axis so that the speeds do not exceed "[Pr.8] Speed limit value".

## [3] Setting method

To use the "speed limit function", set the "speed limit value" in the parameters shown in the following table, and write them to the QD75.

The set details are validated after they are written to the QD75.

| Setting item                  | Setting value | Setting details                                                                                                                                                                    | Factory-set initial value |
|-------------------------------|---------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|---------------------------|
| [Pr.8] Speed limit value      | →             | Set the speed limit value (max. speed during control).                                                                                                                             | 200000                    |
| [Pr.31] JOG speed limit value | →             | Set the speed limit value during JOG operation (max. speed during control). (Note that "[Pr.31] JOG speed limit value" shall be less than or equal to "[Pr.8] Speed limit value".) | 20000                     |

\* Refer to Section 5.2 "List of parameters" for setting details.

**REMARK**

- Parameters are set for each axis.
- It is recommended that the parameters be set whenever possible with GX Configurator-QP. Execution by sequence program uses many sequence programs and devices. The execution becomes complicated, and the scan times will increase.

## 12.4.2 Torque limit function

The "torque limit function" limits the generated torque to a value within the "torque limit value" setting range when the torque generated in the servomotor exceeds the "torque limit value".

The "torque limit function" protects the deceleration function, limits the power of the operation pressing against the stopper, etc. It controls the operation so that unnecessary force is not applied to the load and machine.

The QD75 does not carry out the torque limit of servo motor directly with this function. The torque limit command to servo amplifier is carried out by the D/A converter module.

The details shown below explain about the "torque limit function".

- [1] System configuration for carrying out the torque limit
- [2] Relation between the torque limit function and various controls
- [3] Control details
- [4] Control precautions
- [5] Setting method

### [1] System configuration for carrying out the torque limit

Carry out the torque limit in the configuration in the figure below. (The following modules are required.)

- D/A converter module
- Drive unit capable of torque limit control by analog voltage input

Fig. 12.16 Torque limit to the drive unit (axis 1)

| POINT                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <p>The QD75 monitors the creep speed reach during the OPR control and updates the " <a href="#">Md.35</a> Torque limit stored value" to the " <a href="#">Pr.54</a> OPR torque limit value".</p> <p>Monitoring this value prevents the need to monitor the creep speed reach by the program. If all controls of torque limit value are carried out by the program (1)</p> <p>Reading data by the FROM instruction, this function must not be used.</p> |

## [2] Relation between the torque limit function and various controls

The following table shows the relation of the "torque limit function" and various controls.

| Control type              |                                  |                                                 | Torque limit function | Torque limit value *                                                                                                                                                                     |

○ : Set when required

— : Setting not required (Setting value is invalid. Use the initial values or setting values within a range where no error occurs.)

\* : Shows the torque limit value when " [Cd.22](#) New torque value" is set to "0".

## [3] Control details

The following drawing shows the operation of the torque limit function.

Fig. 12.17 Torque limit function operation

## [4] Control precautions

- (1) When limiting the torque at the "[Pr.17] Torque limit setting value", confirm that "[Cd.22] New torque value" is set to "0". If this parameter is set to a value besides "0", the "[Cd.22] New torque value" will be validated, and the torque will be limited at that value. (Refer to Section 12.5.4 "Torque change function" for details about the "new torque value".)
- (2) When "[Pr.54] OPR shift amount" exceeds "[Pr.17] Torque limit setting value", the error "OPR torque limit value error" (error code: 995) will occur.
- (3) When the operation is stopped by torque limiting, the droop pulse will remain in the deviation counter. If a "deviation counter clear" is carried out by issuing an external signal at this time, positional deviation will occur when the operation is continued. If the load torque is eliminated, operation for the amount of droop pulses will be carried out.

## [5] Setting method

- (1) To use the "torque limit function", set the "torque limit value" in the parameters shown in the following table, and write them to the QD75. The set details are validated at the rising edge (OFF → ON) of the PLC READY signal (Y0).

| Setting item                            | Setting value | Setting details                                                                                   | Factory-set initial value |
|-----------------------------------------|---------------|---------------------------------------------------------------------------------------------------|---------------------------|
| <b>Pr.17</b> Torque limit setting value | →             | Set the torque limit value as a percentage.                                                       | 300                       |
| <b>Pr.54</b> OPR torque limit value     | →             | Set the torque limit value after the " <b>Pr.47</b> Creep speed" is reached. Set as a percentage. | 300                       |

\* Refer to Section 5.2 "List of parameters" for setting details.

The following table shows the " **Md.35** Torque limit stored value" of the buffer memory address.

| Monitor item                           | Monitor value | Storage details                                                                                          | Buffer memory address |        |        |        |
|----------------------------------------|---------------|----------------------------------------------------------------------------------------------------------|-----------------------|--------|--------|--------|
|                                        |               |                                                                                                          | Axis 1                | Axis 2 | Axis 3 | Axis 4 |
| <b>Md.35</b> Torque limit stored value | →             | The "torque limit value" valid at that time is stored. ( <b>Pr.17</b> , <b>Pr.54</b> , or <b>Cd.22</b> ) | 826                   | 926    | 1026   | 1126   |

\* Refer to Section 5.6 "List of monitor data" for information on the setting details.

**REMARK**

- Parameters are set for each axis.
- It is recommended that the parameters be set whenever possible with GX Configurator-QP. Execution by sequence program uses many sequence programs and devices. The execution becomes complicated, and the scan times will increase.

### 12.4.3 Software stroke limit function

In the "software stroke limit function" the address established by a machine OPR is used to set the upper/lower limits of the moveable range of the workpiece. Movement commands issued to addresses outside that setting range will not be executed. In the QD75, the "current feed value" and "machine feed value" are used as the addresses indicating the current position. However, in the "software stroke limit function", the address used to carry out the limit check is designated in the " [Pr.14] Software stroke limit selection". (Refer to Section 9.1.4 "Confirming the current value" or details on the "current feed value" and "machine feed value".)

The upper/lower limits of the moveable range of the workpiece are set in " [Pr.12] Software stroke limit upper limit value"/ " [Pr.13] Software stroke limit lower limit value".

The details shown below explain about the "software stroke limit function".

- [1] Differences in the moveable range when "current feed value" and "machine feed value" are selected.
- [2] Software stroke limit check details
- [3] Relation between the software stroke limit function and various controls
- [4] Precautions during software stroke limit check
- [5] Setting method
- [6] Invalidating the software stroke limit
- [7] Setting when the control unit is "degree"

- [1] Differences in the moveable range when "current feed value" and "machine feed value" are selected.

The following drawing shows the moveable range of the workpiece when the software stroke limit function is used.

Fig. 12.18 Workpiece moveable range

The following drawing shows the differences in the operation when "Md.20 Current feed value" and "Md.21 Machine feed value" are used in the moveable range limit check.

**[Conditions]**

Assume the current stop position is 2000, and the upper stroke limit is set to 5000.

**[Current value changing]**

When the current value is changed by a new current value command from 2000 to 1000, the current value will change to 1000, but the machine feed value will stay the same at 2000.

- 1) When the machine feed value is set at the limit

The machine feed value of 5000 (current feed value: 4000) becomes the upper stroke limit.

- 2) When the current feed value is set at the limit

The current feed value of 5000 (machine feed value: 6000) becomes the upper stroke limit.

Fig. 12.19 Software stroke limits of the current feed value and machine feed value

**POINT**

When "machine feed value" is set in "Pr.14 Software stroke limit selection", the moveable range becomes an absolute range referenced on the OP. When "current feed value" is set, the moveable range is the relative range from the "current feed value".

## [2] Software stroke limit check details

| Check details |                                                                                                                                                                        | Processing when an error occurs                                                                      |
|---------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------|------------------------------------------------------------------------------------------------------|
| 1)            | An error shall occur if the current value *1 is outside the software stroke limit range *2.<br>(Check " [Md.20] Current feed value" or " [Md.21] Machine feed value".) | An error "Software stroke limit +" or "Software stroke limit -" (error code: 507 or 508) will occur. |
| 2)            | An error shall occur if the command address is outside the software stroke limit range.<br>(Check " [Da.6] Positioning address/movement amount".)                      |                                                                                                      |

\*1: Check whether the " [Md.20] Current feed value" or " [Md.21] Machine feed value" is set in " [Pr.14] Software stroke limit selection".

\*2: Moveable range from the " [Pr.12] Software stroke limit upper limit value" to the " [Pr.13] Software stroke limit lower limit value".

◎ : Check valid

○ : Check is not made when the current feed value is not updated (Refer to [Pr.21] at the setting of " current feed value" in " [Pr.14] Software stroke limit selection" during speed control.

— : Check not carried out (check invalid).

△ : Valid only when "0:valid" is set in the " [Pr.15] Software stroke limit valid/invalid setting".

\*3: The value in " [Md.20] Current feed value" will differ according to the " [Pr.21] Current feed value during speed control" setting.

\*4: When the unit is "degree", check is not made during speed control.

\*5: When the unit is "degree", check is not carried out.

#### [4] Precautions during software stroke limit check

- (1) A machine OPR must be executed beforehand for the "software stroke limit function" to function properly.
- (2) During interpolation control, a stroke limit check is carried out for the every current value of both the reference axis and the interpolation axis. Every axis will not start if an error occurs, even if it only occurs in one axis.
- (3) During circular interpolation control, the " Pr.12 Software stroke limit upper limit value"/" Pr.13 Software stroke limit lower limit value" may be exceeded.

In this case, a deceleration stop will not be carried out even if the stroke limit is exceeded. Always install an external limit switch if there is a possibility the stroke limit will be exceeded.

- (4) If an error is detected during continuous path control, the axis stops immediately on completion of execution of the positioning data located right before the positioning data in error.

- (5) During simultaneous start, a stroke limit check is carried out for the current values of every axis to be started. Every axis will not start if an error occurs, even if it only occurs in one axis.

#### [5] Setting method

To use the "software stroke limit function", set the required values in the parameters shown in the following table, and write them to the QD75.

The set details are validated at the rising edge (OFF → ON) of the PLC READY signal (Y0).

| Setting item                                             | Setting value | Setting details                                                                                                                                               | Factory-set initial value |
|----------------------------------------------------------|---------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------|---------------------------|
| <b>Pr.12</b> Software stroke limit upper limit value     | →             | Set the upper limit value of the moveable range.                                                                                                              | 2147483647                |
| <b>Pr.13</b> Software stroke limit lower limit value     | →             | Set the lower limit value of the moveable range.                                                                                                              | -2147483648               |
| <b>Pr.14</b> Software stroke limit selection             | →             | Set whether to use the " <b>Md.20</b> Current feed value" or " <b>Md.21</b> Machine feed value" as the "current value".                                       | 0: Current feed value     |
| <b>Pr.15</b> Software stroke limit valid/invalid setting | 0: Valid      | Set whether the software stroke limit is validated or invalidated during manual control (JOG operation, Inching operation, manual pulse generator operation). | 0: valid                  |

\* Refer to Section 5.2 "List of parameters" for setting details.

#### [6] Invalidating the software stroke limit

To invalidate the software stroke limit, set the following parameters as shown, and write them to the QD75. (Set the value within the setting range.)

$$\boxed{\text{Pr.12}} \text{ Software stroke limit upper limit value} = \boxed{\text{Pr.13}} \text{ Software stroke limit lower limit value}$$

To invalidate only the manual operation, set "1: software stroke limit invalid" in the " **Pr.15** Software stroke limit valid/invalid setting".

The set details are validated at the rising edge (OFF → ON) of the PLC READY signal (Y0).

When the unit is "degree", the software stroke limit check is not performed during speed control (including speed control in speed-position switching control or position-speed switching control) or during manual control, independently of the values set in **Pr.12**, **Pr.13** and **Pr.15**.

#### REMARK

- Parameters are set for each axis.
- It is recommended that the parameters be set whenever possible with GX Configurator-QP. Execution by sequence program uses many sequence programs and devices. The execution becomes complicated, and the scan times will increase.

## [7] Setting when the control unit is "degree"

## ■ Current value address

The " Md.20 Current feed value" address is a ring address between 0 and 359.99999°.

Fig. 12.20 Current value address when the control unit is "degree"

## ■ Setting the software stroke limit

The upper limit value/lower limit value of the software stroke limit is a value between 0 and 359.99999°.

## (1) Setting when the software stroke limit is to be validated.

When the software stroke limit is to be validated, set the upper limit value in a clockwise direction from the lower limit value.

Fig. 12.21 Software stroke limit when the control unit is "degree"

## 12.4.4 Hardware stroke limit function

**⚠ WARNING**

When the hardware stroke limit is required to be wired, ensure to wire it in the negative logic using b-contact. If it is set in positive logic using a-contact, a serious accident may occur.

In the "hardware stroke limit function", limit switches are set at the upper/lower limit of the physical moveable range, and the control is stopped (by deceleration stop) by the input of a signal from the limit switch. Damage to the machine can be prevented by stopping the control before the upper/lower limit of the physical moveable range is reached.

Hardware stroke limit switches are normally "installed inside the stroke limit/stroke end on the drive unit side", and the control is stopped before the stroke limit/stroke end on the drive unit side is reached.

The details shown below explain about the "hardware stroke limit function".

- [1] Control details
- [2] Wiring the hardware stroke limit
- [3] Control Precautions
- [4] When the hardware stroke limit is not used

**[1] Control details**

The following drawing shows the operation of the hardware stroke limit function.

Fig. 12.22 Hardware stroke limit function operation

### [2] Wiring the hardware stroke limit

When using the hardware stroke limit function, wire the terminals of the QD75 upper/lower limit stroke limit as shown in the following drawing.

(When " **Pr.22** Input signal logic selection" is set to the initial value)

Fig. 12.23 Wiring when using the hardware stroke limit

### [3] Control Precautions

- (1) If the machine is stopped outside the QD75 control range (outside the upper/lower limit switches), or if stopped by hardware stroke limit detection, the "OPR control", "major positioning control", and "high-level positioning control" cannot start. To carry out these types of control again, return the workpiece to the QD75 control range by a "JOG operation", "inching operation" or "manual pulse generator operation".
- (2) When " **Pr.22** Input signal logic selection" is set to the initial value, the QD75 cannot carry out the positioning control if FLS (upper limit signal) is separated from COM or RLS (lower limit signal) is separated from COM (including when wiring is not carried out).

### [4] When the hardware stroke limit function is not used

When not using the hardware stroke limit function, wire the terminals of the QD75 upper/lower limit stroke limit as shown in the following drawing.

When the logic of FLS and RLS is set to "positive logic" using " **Pr.22** Input signal logic selection", positioning control can be carried out even if FLS and RLS are not wired.

(For details, refer to Section 13.4 "External I/O signal logic switching function".)

Fig. 12.24 Wiring when not using the hardware stroke limit function  
(When " **Pr.22** Input signal logic selection" is the initial value)

## 12.5 Functions to change the control details

Functions to change the control details include the "speed change function", "override function", "acceleration/deceleration time change function" and "torque change function". Each function is executed by parameter setting or sequence program creation and writing.

Both the "speed change function" or "override function" change the speed, but the differences between the functions are shown below. Use the function that corresponds to the application.

### "Speed change function"

- The speed is changed at any time, only in the control being executed.
- The new speed is directly set.

### "Override function"

- The speed is changed for all control to be executed. (Note that this excludes manual pulse generator operation.)
- The new speed is set as a percent (%) of the command speed.

### 12.5.1 Speed change function

The "Speed change function" is used to change the speed during control to a newly designated speed at any time.

The new speed is directly set in the buffer memory, and the speed is changed by a speed change command ([Cd.15](#) Speed change request) or external command signal.

During the machine OPR, a speed change to the creep speed cannot be carried out after deceleration start because the near point dog ON is detected.

The details shown below explain about the "speed change function".

- [1] Control details
- [2] Control precautions
- [3] Setting the speed change function from the CPU module
- [4] Setting the speed change function using an external command signal

#### [1] Control details

The following drawing shows the operation during a speed change.

Fig. 12.25 Speed change operation

## [2] Control precautions

- (1) Control is carried out as follows at the speed change during continuous path control.
  - a) When no speed designation (current speed) is provided in the next positioning data:
    - The next positioning data is controlled at the " Cd.14 New speed value".
  - b) When a speed designation is provided in the next positioning data:
    - The next positioning data is controlled at its command speed ( Da.8 ).

Fig. 12.26 Speed change during continuous path control

- (2) When changing the speed during continuous path control, the speed change will be ignored if there is not enough distance remaining to carry out the change.
- (3) When the stop command was given to make a stop after a speed change that had been made during position control, the restarting speed depends on the function version.

| Function version | Restarting speed                                                                    |
|------------------|-------------------------------------------------------------------------------------|
| A                | <span style="border: 1px solid black; padding: 0 2px;">Da.8</span> Command speed    |
| B or later       | <span style="border: 1px solid black; padding: 0 2px;">Cd.14</span> New speed value |

Refer to Section 2.4 for the way to check the function version.

Fig. 12.27 Restarting speed after speed change made during position control (Function version B)

- (4) When the speed is changed by setting " **Cd.14** New speed value" to "0", the operation is carried out as follows.
- When " **Cd.15** Speed change request" is turned ON, the speed change 0 flag ( **Md.31** Status: b10) turns ON.  
(During interpolation control, the speed change 0 flag on the reference axis side turns ON.)
  - The axis stops, but " **Md.26** Axis operation status" does not change, and the BUSY signal remains ON. (If a stop signal is input, the BUSY signal will turn OFF, and " **Md.26** Axis operation status" will change to "Stopped".)
- \*In this case, setting the " **Cd.14** New speed value" to a value besides "0" will turn OFF the speed change 0 flag ( **Md.31** Status: b10), and enable continued operation.

Fig. 12.28 Speed change at new speed value "0"

- (5) A warning "Deceleration/stop speed change" (warning code: 500) occurs and the speed cannot be changed in the following cases.
- During deceleration by a stop command
  - During automatic deceleration during positioning control
- (6) A warning "Speed limit value over" (warning code: 501) occurs and the speed is controlled at the " **Pr.8** Speed limit value" when the value set in " **Cd.14** New speed value" exceeds the " **Pr.8** Speed limit value".
- (7) When the speed is changed during interpolation control, the required speed is set in the reference axis.
- (8) When carrying out consecutive speed changes, be sure there is an interval between the speed changes of 100ms or more.  
(If the interval between speed changes is short, the QD75 will not be able to track, and it may become impossible to carry out commands correctly.)
- (9) When a speed change is requested simultaneously for multiple axes, change the speed one by one. Therefore, the start timing of speed change is different for each axis.
- (10) The speed cannot be changed to 0 during the machine OPR. The speed change request is ignored.
- (11) When deceleration is started by the speed change function, the deceleration start flag does not turn ON.

### [3] Setting the speed change function from the CPU module

The following shows the data settings and sequence program example for changing the control speed of axis 1 from the CPU module. (In this example, the control speed is changed to "20.00mm/min".)

(1) Set the following data.

(Use the start time chart shown in section (2) below as a reference, and set using the sequence program shown in section (3).)

| Setting item                      | Setting value | Setting details            | Buffer memory address |              |              |              |
|-----------------------------------|---------------|----------------------------|-----------------------|--------------|--------------|--------------|
|                                   |               |                            | Axis 1                | Axis 2       | Axis 3       | Axis 4       |
| <b>Cd.14</b> New speed value      | 2000          | Set the new speed.         | 1514<br>1515          | 1614<br>1615 | 1714<br>1715 | 1814<br>1815 |
| <b>Cd.15</b> Speed change request | 1             | Set "1: Change the speed". | 1516                  | 1616         | 1716         | 1816         |

\* Refer to Section 5.7 "List of control data" for details on the setting details.

(2) The following shows the speed change time chart.

Fig. 12.29 Time chart for changing the speed from the CPU module

(3) Add the following sequence program to the control program, and write it to the CPU module.

#### [4] Setting the speed change function using an external command signal

The speed can also be changed using an "external command signal".

The following shows the data settings and sequence program example for changing the control speed of axis 1 using an "external command signal". (In this example, the control speed is changed to "10000.00mm/min".)

- (1) Set the following data to change the speed using an external command signal.

(Use the start time chart shown in section (2) below as a reference, and set using the sequence program shown in section (3).)

| Setting item                              | Setting value | Setting details                         | Buffer memory address |              |              |              |
|-------------------------------------------|---------------|-----------------------------------------|-----------------------|--------------|--------------|--------------|
|                                           |               |                                         | Axis 1                | Axis 2       | Axis 3       | Axis 4       |
| Pr.42 External command function selection | 1             | Set "1: External speed change request". | 62                    | 212          | 362          | 512          |
| Cd.8 External command valid               | 1             | Set "1: Validate the external command". | 1505                  | 1605         | 1705         | 1805         |
| Cd.14 New speed value                     | 1000000       | Set the new speed.                      | 1514<br>1515          | 1614<br>1615 | 1714<br>1715 | 1814<br>1815 |

\* Refer to Section 5.7 "List of control data" for details on the setting details.

- (2) The following shows the speed change time chart.

Fig. 12.30 Time chart for changing the speed using an external command signal

- (3) Add the following sequence program to the control program, and write it to the CPU module.

Example

## 12.5.2 Override function

The "override function" changes the command speed by a designated percentage (1 to 300%) for all control to be executed.

The speed can be changed by setting the percentage (%) by which the speed is changed in " [Cd.13] Positioning operation speed override".

- [1] Control details
- [2] Control precautions
- [3] Setting method

## [1] Control details

The following shows that operation of the override function.

- 1) A value changed by the override function is monitored by " [Md.22] Feedrate". (When [Md.22] " becomes "0", the warning "Less than minimum speed" (warning code: 110) is generated and the axis is controlled in the then speed unit of "1".)
- 2) If " [Cd.13] Positioning operation speed override" is set to 100%, the speed will not change.
- 3) If " [Cd.13] Positioning operation speed override" is set a value 100% or less, the warning "Less than minimum speed" (warning code: 110) is generated, and control will be carried out at speed unit "1" at the time "Feedrate" becomes a value of "1" or less.
- 4) If there is not enough remaining distance to change the speed by the "override function" during the "position control" or position control by the "speed-position switching control" or "position-speed switching control", the operation will be carried out at the possible speed for the distance.
- 5) If the speed changed by the "override function" is greater than the " [Pr.8] Speed limit value", a warning "Speed limit value over" (warning code: 501) will occur and the speed will be controlled at the " [Pr.8] Speed limit value". The " [Md.39] In speed limit flag" will turn ON.

Fig. 12.31 Override function operation

## [2] Control precautions

- (1) When changing the speed by the "override function" during continuous path control, the speed change will be ignored if there is not enough distance remaining to carry out the change.
- (2) A warning "Deceleration/stop speed change" (warning code: 500) occurs and the speed cannot be changed by the "override function" in the following cases.  
(The value set in " Cd.13 Positioning operation speed override" is validated after a deceleration stop.)
  - During deceleration by a stop command
  - During automatic deceleration during positioning control
- (3) When the speed is changed by the "override function" during interpolation control, the required speed is set in the reference axis.
- (4) When carrying out consecutive speed changes by the "override function", be sure there is an interval between the speed changes of 100ms or more.  
(If the interval between speed changes is short, the QD75 will not be able to track, and it may become impossible to carry out commands correctly.)
- (5) When a machine OPR is performed, the speed change by the "override function" cannot be carried out after a deceleration start to the creep speed following the detection of near-point dog ON. In this case, a request for speed change is ignored.
- (6) When deceleration is started by the override function, the deceleration start flag does not turn ON.

## [3] Setting method

The following shows the data settings and sequence program example for setting the override value of axis 1 to "200%".

- (1) Set the following data. (Use the start time chart shown in section (2) below as a reference, and set using the sequence program shown in section (3).)

| Setting item                                                        |                                      | Setting value | Setting details                        | Buffer memory address |        |        |        |
|---------------------------------------------------------------------|--------------------------------------|---------------|----------------------------------------|-----------------------|--------|--------|--------|
|                                                                     |                                      |               |                                        | Axis 1                | Axis 2 | Axis 3 | Axis 4 |
| <span style="border: 1px solid black; padding: 0 2px;">Cd.13</span> | Positioning operation speed override | 200           | Set the new speed as a percentage (%). | 1513                  | 1613   | 1713   | 1813   |

\* Refer to Section 5.7 "List of control data" for details on the setting details.

The diagram shows the relationship between voltage (V) and time (t) during a positioning operation. The voltage profile starts at zero, ramps up to a peak, and then ramps down to zero. A horizontal dashed line indicates the dwell time at the peak voltage. Below the voltage profile, several digital signals are shown as step functions:

- Positioning start signal [Y10]:** Transitions from low to high at the start of the ramp-up phase and returns to low at the end of the dwell time.
- PLC READY signal [Y0]:** Transitions from low to high at the start of the ramp-up phase and returns to low at the end of the dwell time.
- QD75 READY signal [X0]:** Transitions from low to high at the start of the ramp-up phase and returns to low at the end of the dwell time.
- Start complete signal [X10]:** Transitions from low to high at the start of the ramp-up phase and returns to low at the end of the dwell time.
- BUSY signal [XC]:** Transitions from high to low at the start of the ramp-up phase and returns to high at the end of the dwell time.
- Positioning complete signal [X14]:** Transitions from low to high at the end of the dwell time and returns to low at the end of the dwell time.
- Error detection signal [X8]:** Remains low throughout the operation.

At the bottom, a box labeled "Cd. 13" is shown, with a horizontal line indicating the positioning operation speed override. The value "200" is shown in a box, indicating the speed override factor.

### 12.5.3 Acceleration/deceleration time change function

The "acceleration/deceleration time change function" is used to change the acceleration/deceleration time during a speed change to a random value when carrying out the speed change by the "speed change function" and "override function". In a normal speed change (when the acceleration/deceleration time is not changed), the acceleration/deceleration time previously set in the parameters ([Pr.9], [Pr.10], and [Pr.25] to [Pr.30] values) is set in the positioning parameter data items [Da.3] and [Da.4], and control is carried out with that acceleration/deceleration time. However, by setting the new acceleration/deceleration time ([Cd.10], [Cd.11]) in the control data, and issuing an acceleration/deceleration time change enable command ([Cd.12] Acceleration/deceleration time change during speed change, enable/disable selection) to change the speed when the acceleration/deceleration time change is enabled, the speed will be changed with the new acceleration/deceleration time ([Cd.10], [Cd.11]).

The details shown below explain about the "acceleration/deceleration time change function".

- [1] Control details
- [2] Control precautions
- [3] Setting method

## [1] Control details

After setting the following two items, carry out the speed change to change the acceleration/deceleration time during the speed change.

- Set change value of the acceleration/deceleration time (" [Cd.10] New acceleration time value", " [Cd.11] New deceleration time value")
- Setting acceleration/deceleration time change to enable (" [Cd.12] Acceleration/deceleration time change during speed change, enable/disable selection")

The following drawing shows the operation during an acceleration/deceleration time change.

Fig. 12.33 Operation during an acceleration/deceleration time change

## [2] Control precautions

- (1) When "0" is set in " Cd.10 New acceleration time value" and " Cd.11 New deceleration time value", the acceleration/deceleration time will not be changed even if the speed is changed. In this case, the operation will be controlled at the acceleration/deceleration time previously set in the parameters.
- (2) The "new acceleration/deceleration time" is valid during execution of the positioning data for which the speed was changed. In continuous positioning control and continuous path control, the speed is changed and control is carried out with the previously set acceleration/deceleration time at the changeover to the next positioning data, even if the acceleration/deceleration time is changed to the "new acceleration/deceleration time ( Cd.10, Cd.11 )".
- (3) Even if the acceleration/deceleration time change is set to disable after the "new acceleration/deceleration time" is validated, the positioning data for which the "new acceleration/deceleration time" was validated will continue to be controlled with that value. (The next positioning data will be controlled with the previously set acceleration/deceleration time.)

- (4) If the "new acceleration/deceleration time" is set to "0" and the speed is changed after the "new acceleration/deceleration time" is validated, the operation will be controlled with the previous "new acceleration/deceleration time".

### POINT

If the speed is changed when an acceleration/deceleration change is enabled, the "new acceleration/deceleration time" will become the acceleration/deceleration time of the positioning data being executed. The "new acceleration/deceleration time" remains valid until the changeover to the next positioning data. (The automatic deceleration processing at the completion of the positioning will also be controlled by the "new acceleration/deceleration time".)

### [3] Setting method

To use the "acceleration/deceleration time change function", write the data shown in the following table to the QD75 using the sequence program.

The set details are validated when a speed change is executed after the details are written to the QD75.

| Setting item                                                                               | Setting value | Setting details                                        | Buffer memory address |              |              |              |
|--------------------------------------------------------------------------------------------|---------------|--------------------------------------------------------|-----------------------|--------------|--------------|--------------|
|                                                                                            |               |                                                        | Axis 1                | Axis 2       | Axis 3       | Axis 4       |

### 12.5.4 Torque change function

The "torque change function" is used to change the torque limit value during torque limiting.

The torque limit value during torque limiting is normally the value set in the " [Pr.17] Torque limit setting value" that was previously set in the parameters.

However, by setting the new torque limit value in the axis control data " [Cd.22] New torque value", and writing it to the QD75, the torque generated by the servomotor during control can be limited with the new torque value.

(The " [Cd.22] New torque value" is validated when written to the QD75.)

The details shown below explain about the "torque change function".

- [1] Control details
- [2] Control precautions
- [3] Setting method

#### [1] Control details

The torque value of the axis control data can be changed at all times. The torque can be limited with a new torque value from the time the new torque value has been written to the QD75. (a torque change is made only during operation.) The torque limiting is not carried out from the time the power supply is turned ON to the time the PLC READY signal (Y0) is turned ON.

The torque setting range is from 0 to " [Pr.17] Torque limit setting value".

When the new torque value is 0, a torque change is considered not to be carried out.

The torque change range is 1 to " [Pr.17] Torque limit setting value".

The following drawing shows the torque change operation.

Fig. 12.34 Torque change operation

## [2] Control precautions

- (1) If a value besides "0" is set in the " Cd.22 New torque value", the torque generated by the servomotor will be limited by that value. To limit the torque with the value set in " Pr.17 Torque limit setting value", set the " Cd.22 New torque value" to "0".
- (2) The " Cd.22 New torque value" is validated when written to the QD75. (Note that it is not validated from the time the power supply is turned ON to the time the PLC READY signal (Y0) is turned ON.)
- (3) If the setting value is outside the setting range, an axis warning "Outside new torque value range" (warning code: 113) will occur and the torque will not be changed.
- (4) If the time to hold the new torque value is not more than 100ms, a torque change may not be executed.

## [3] Setting method

To use the "torque change function", write the data shown in the following table to the QD75 using the sequence program.

The set details are validated when written to the QD75.

| Setting item                                                                         | Setting value | Setting details                 | Buffer memory address |        |        |        |
|--------------------------------------------------------------------------------------|---------------|---------------------------------|-----------------------|--------|--------|--------|
|                                                                                      |               |                                 | Axis 1                | Axis 2 | Axis 3 | Axis 4 |
| <span style="border: 1px solid black; padding: 0 2px;">Cd.22</span> New torque value | →             | Set the new torque limit value. | 1525                  | 1625   | 1725   | 1825   |

\* Refer to Section 5.7 "List of control data" for details on the setting details.

## 12.5.5 Target position change function

The "target position change function" is a function to change a target position to a newly designated target position at any timing during the position control (1-axis linear control). A command speed can also be changed simultaneously.

The target position and command speed changed are set directly in the buffer memory, and the target position change is executed by turning ON " Cd.29 Target position change request flag".

The following shows the details of the "target position change function".

[1] Control details

[2] Control precautions

[3] Setting method

## [1] Control details

The following charts show the details of control of the target position change function.

Fig. 12.35 Target position change operation

**[2] Control precautions**

- (1) If the positioning movement direction from the stop position to a new target position is reversed, stop the operation once and then position to the new target position. (Refer to Fig. 12.35 (c).)
- (2) If a command speed exceeding the speed limit value is set to change the command speed, the warning "Speed limit value over" (warning code: 501) will occur, and the new command speed will be the speed limit value. Also, if the command speed change disables the remaining distance to the target value from being assured, the warning "Insufficient remaining distance" (warning code: 509) will occur.
- (3) In the following cases, the target position change request is ignored, and the warning "Target position change not possible" (warning code: 518) will occur.
  - During interpolation control
  - A new target position value (address) is outside the software stroke limit range.
  - The axis is decelerating to a stop by a stop cause.
  - While the positioning data whose operation pattern is continuous path control is executed.
  - When the speed change 0 flag (**Md.31** Status: b10) is ON.
- (4) When a command speed is changed, the current speed is also changed. When the next positioning speed uses the current speed in the continuous positioning, the next positioning operation is carried out at the new speed value. When the speed is set with the next positioning data, that speed becomes the current speed and the operation is carried out at the current speed.
- (5) When a target position change request is given during automatic deceleration in position control, positioning control to a new position is exercised after the axis has stopped once if the moving direction is reversed. If the moving direction is not reversed, the axis is accelerated to the command speed again and positioned to the new position.
- (6) If the constant speed status is regained or the output is reversed by a target position change made while " **Md.48** Deceleration start flag" is ON, the deceleration start flag remains ON. (For details, refer to Section 12.7.8.)
- (7) Carrying out the target position change to the ABS linear 1 in degrees may carry out the positioning to the new target position after the operation decelerates to stop once, even the movement direction is not reversed.

**POINT**

When carrying out the target position change continuously, take an interval of 100ms or longer between the times of the target position changes. Also, take an interval of 100ms or longer when the speed change and override is carried out after changing the target position or the target position change is carried out after the speed change and override.

### [3] Setting method

The following table and chart show the example of a data setting and program used to change the target position of the axis 1 by the command from CPU module, respectively."

(In this example, the target position and command speed is changed to "300.0  $\mu$ m" and "10000.00 mm/min".)

- (1) The following data is set.  
(Referring to the starting time chart shown in item (2) below, carry out the setting with the program shown in item (3).)

| Setting item                                            | Setting value | Setting details                  | Buffer memory address |              |              |              |
|---------------------------------------------------------|---------------|----------------------------------|-----------------------|--------------|--------------|--------------|
|                                                         |               |                                  | Axis 1                | Axis 2       | Axis 3       | Axis 4       |
| <b>Cd.27</b> Target position change value (new address) | 3000          | Set the new address.             | 1534<br>1535          | 1634<br>1635 | 1734<br>1735 | 1834<br>1835 |
| <b>Cd.28</b> Target position change value (new speed)   | 1000000       | Set the new speed.               | 1536<br>1537          | 1636<br>1637 | 1736<br>1737 | 1836<br>1837 |
| <b>Cd.29</b> Target position change request flag        | 1             | Set "1: Carry out speed change". | 1538                  | 1638         | 1738         | 1838         |

Refer to Section 5.7 "List of control data" for details on the setting details.

- (2) The following shows the time chart for target position change.

Fig. 12.36 Time chart for target position change from CPU module

(3) The following program is added to the control program, and written to the CPU module.

## 12.6 Absolute position restoration function

### ⚠ CAUTION

An absolute position restoration by the positioning function may turn off the servo-on signal (servo off) for approximately 60ms + scan time, and the motor may run unexpectedly. If this causes a problem, provide an electromagnetic brake to lock the motor during absolute position restoration.

The "absolute position restoration function" is a function to restore the absolute position of the designated axis by the absolute position detection system. By this function, the OPR after power OFF such as instantaneous power interruption and emergency stop is not required, and the restoration operation at site can be carried out easily.

The details of the "absolute position restoration function" are described below.

- [1] Configuration and preparation of absolute position detection system
- [2] Outline of absolute position detection data communication
- [3] Absolute position signal transmission procedure
- [4] Control precautions

#### [1] Configuration and preparation of absolute position detection system

##### (1) Configuration

The following drawing shows the configuration of the absolute position detection system.

Fig. 12.37 Configuration of absolute position detection system

## (2) Preparation

Prepare the absolute position detection system taking care of the following.

| Component                         | Details                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
|-----------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 1) Servo amplifier                | <ul style="list-style-type: none"> <li>• Use a Mitsubishi Electric General-Purpose AC Servo which has an absolute position detection function (absolute position data transference protocol) equivalent to that of MR-J3-□A).</li> <li>• Install the battery to the servo amplifier.</li> <li>• Validate the absolute position detection function of the servo amplifier.</li> </ul> <p>Refer to the servo amplifier manual for details.</p>             |
| 2) Servomotor                     | <ul style="list-style-type: none"> <li>• Use a servomotor with absolute position detector.</li> </ul> <p>Refer to the servomotor manual for details.</p>                                                                                                                                                                                                                                                                                                 |
| 3) Detector cable                 | <ul style="list-style-type: none"> <li>• Add a battery power connection cable (BAT/LG signal) for wiring the incremental detector cable.</li> </ul> <p>Refer to the cable operation manual for details.</p>                                                                                                                                                                                                                                              |
| 4) Programmable controller system | <ul style="list-style-type: none"> <li>• Carry out the transmission and receiving of the absolute position detection data by the I/O modules (input 3 points/output 3 points).</li> <li>• As input/output modules, use the "16 point input module" and "16 point output module".</li> <li>• Place the 3 points of input signals so that the □ □ is the same among the input number □ □0 to □ □F. The same for the 3 points of output signals.</li> </ul> |

## [2] Outline of absolute position detection data communication

As shown in Fig. 12.38 System block diagram, the detector comprises an encoder for detecting its position in one rotation in addition to the A, B, Z phase signal for position control in normal operation and a cumulative rotation counter for detecting the number of rotations.

The absolute position detection system detects the absolute position of the machine constantly and stores it with the backup of the battery irrespective of whether the programmable controller system power is turned ON/OFF. Thus, once the OP initial setting is carried out at the time of installation of the machine, the OPR is not required even when the power is later turned ON. The restoration can be carried out easily when an instantaneous power interruption or emergency stop occurs.

In addition, because the absolute position data is backed up by a super condenser built in the detector, the absolute position data will be stored for a specified time even if the cable is disconnected or broken.

Fig. 12.38 System block diagram

### [3] Absolute position signal transmission procedure

(1) Figure 12.39 shows the outline of the absolute position signal transmission procedure between the servo amplifier and the programmable controller system (CPU module, QD75, I/O module).

Refer to the operation manual of the servo amplifier for details on the communication between the servo amplifier and the programmable controller system.

(2) Errors during communication

(a) If the system expires during communication, an error "ABS transmission time" (error code: 213) will occur.

(b) If the transmission data causes a sum error, an error "ABS transmission SUM" (error code: 214) will occur.

\*Refer to Section 15.3 "List of errors" for the remedial method to be taken when an error occurs.

Fig. 12.39 Absolute position signal transmission procedure

\* Refer to CHAPTER 14 "DEDICATED INSTRUCTIONS" for details of the dedicated instructions.

## (3) Connection example

The following diagram shows the example of connection between the programmable controller system and the Mitsubishi Electric servo amplifier (MR-J3-A).

\*: The X and Y devices can be set arbitrarily with the program.

## Details of servo amplifier connector pins

The following table shows the pins for setting the "absolute position detection system".

| Signal name                 | Abbreviation | Pin No. | Function and application                                                                                                                                                                                           |
|-----------------------------|--------------|---------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| ABS transfer mode           | ABSM         | 17*     | While the ABSM is turned ON, the servo amplifier is in the ABS transfer mode, and the CN1-22 • 23 • 25 functions are as shown in this table.                                                                       |
| ABS request                 | ABSR         | 18*     | The ABSR is turned ON when ABS data is requested in the ABS transfer mode.                                                                                                                                         |
| ABS transmission data bit 0 | ABSB0        | 22      | This indicates the lower order bit among 2 bits of ABS data to be transferred from the servo amplifier to the programmable controller system in the ABS transfer mode. The ABSB0 turns ON when this signal occurs. |
| ABS transmission data bit 1 | ABSB1        | 23      | This indicates the upper order bit among 2 bits of ABS data to be transferred from the servo amplifier to the programmable controller system in the ABS transfer mode. The ABSB1 turns ON when this signal occurs. |
| ABS Transmission data ready | ABST         | 25      | This indicates the ABS transmission data preparation completed in the ABS transfer mode. When the preparation is completed, the ABST is turned ON.                                                                 |

\* When "use in the absolute position detection system" is selected in the parameter No. PA03, the pin 17 is the ABS transfer mode (ABSM), and the pin 18 is the ABS request (ABSR). The signals do not return to the original signal even after the data transfer is completed.

For details on signals of the pin 17 and 18 when the ABS transfer mode is off and I/O interface, refer to the manual of the servo amplifier (MR-J3-A).

The following drawing shows an operation when data is transferred to the servo amplifier.

\*1: Approx. 60ms + scan time

Fig. 12.40 Signal state during the absolute position detection

- 1) The BUSY signal is turned ON and the axis operation status is set to "Analyzing" by the dedicated instruction "ABRST□".  
At this time, the signal is controlled to turn OFF the servo amplifier.  
The servo is powered OFF in 60ms + scan time.
- 2) When the servo is turned ON, the ABS transfer mode is simultaneously turned ON.  
After receiving the ABS transfer mode, detecting the absolute position and calculating the absolute position, the servo amplifier will turn ON the ABS transmission data ready (ABST) and answer back to QD75 notifying that the send data is ready.
- 3) After recognizing that the ABS transmission data ready (ABST) turned ON, QD75 turns ON the ABS request (ABSR).

- 4) The servo amplifier outputs the ABS lower 2 bits and ABS transmission data ready (ABST) OFF by the ABS request (ABSR).
- 5) After recognizing that the ABS transmission data ready (ABST) turned OFF (the ABS2bit data is output), QD75 reads the lower 2bits of ABS and turns OFF the ABS request (ABSR).
- 6) The servo amplifier turns ON the ABS transmission data ready (ABST) and prepares for the next transmission. After that, procedures 3) to 6) are repeated until the data corresponding to 32bits and the checksum corresponding to 6bits are sent.
- 7) After the sum check, the QD75 turns OFF the ABS transfer mode (ABSM). If the ABS transfer mode (ABSM) is turned OFF during the data transmission, the ABS transfer mode will be interrupted.

#### [4] Control precautions

- (1) When an absolute position detection system is constructed, absolute position restoration must be made at least once after power supply on or resetting. Also, the servo amplifier does not switch on unless the absolute position restoration is completed.
- (2) For use of positioning in an absolute position detection system, the following controls cannot be carried out:
  - Limitless-feed control which exercises control only in the fixed direction, e.g. turntable
  - Control where the movement amount from the OP address exceeds the range of the following conditions 1 and 2

When performing positioning in an absolute position detection system, use it in the range which satisfies Conditions 1 and 2 given below.

In the range which does not satisfy Conditions 1 and 2, positioning cannot be used in the absolute position detection system since the normal current value cannot be provided during absolute position restoration.

#### Condition 1. Number of output pulses

- a) Indicates the number of pulses that may be output to a servo amplifier when an axis is to be positioned from the OP in an absolute position detection system. In the absolute position detection system, pulses within the range of the following expression can be output to the servo amplifier.

$$[-32768 \times (\text{number of feedback pulses})] \leq [\text{number of output pulses}] \leq [32768 \times (\text{number of feedback pulses}) - 1]$$

- b) Pulses are positive in the address increasing direction from the OP, and negative in the address decreasing direction from the OP.

- c) The number of output pulses varies with the number of feedback pulses as indicated below:

- When the number of feedback pulses is 8192 (pulse):  
-268435456 (pulse) to 268435455 (pulse)
- When the number of feedback pulses is 16384 (pulse):  
-536870912 (pulse) to 536870911 (pulse)

When the electronic gear of the servo amplifier is used, the electronic gear ratio must be considered. The actual range of the number of output pulses is the value of the range of output pulses above multiplied by the inverse number of the electronic gear ratio.

#### Condition 2. Positioning address

- a) The following positioning addresses can be specified on the QD75:

- When the unit is mm: -214748364.8 ( $\mu\text{m}$ ) to 214748364.7 ( $\mu\text{m}$ )
- When the unit is inch: -21474.83648 (inch) to 21474.83647 (inch)
- When the unit is pulse: -2147483648 (pulse) to 2147483647 (pulse)
- When the unit is degree:  $0^\circ$  to  $359.99999^\circ$

### [Calculation of positioning address and concept of absolute position detection system]

Use the following expression to calculate the positioning address.

$$(\text{Positioning address}) = (\text{movement amount per pulse}) \times (\text{number of output pulses}) + (\text{OP address}) \dots\dots\dots \text{Expression 1}$$

#### 1. Concept for the unit of mm, inch or pulse

The range which satisfies Conditions 1 and 2 can be used as the positioning address of the absolute position detection system.

The range which does not satisfy Conditions 1 and 2 cannot be used as the positioning address of the absolute position detection system.

The concepts of the positioning addresses in mm, inch and pulse are identical, the following examples provide those of the mm unit.

#### Example 1.

(1) There are the following conditions to calculate the positioning address:

- Movement amount per pulse: 0.1 (μm)
- OP address: 0.0 (μm)
- Feedback pulses = 8192 (pulse)

(2) Calculate the upper/lower limit values of the positioning address which can be specified from the output pulse count using range in Condition 1 and the positioning address calculation expression (Expression 1).

- Lower limit value of positioning address (the number of negative pulses in Condition 1 is used for calculation)

$$\begin{aligned} (\text{Positioning address}) &= (\text{Movement amount per pulse}) \\ &\quad \times (\text{number of output pulses}) + (\text{OP address}) \\ &= 0.1 \times (-268435456) + 0.0 \\ &= -26843545.6(\mu\text{m}) \end{aligned}$$

- Upper limit value of positioning address (the number of positive pulses in Condition 1 is used for calculation)

$$\begin{aligned} (\text{Positioning address}) &= (\text{Movement amount per pulse}) \\ &\quad \times (\text{number of output pulses}) + (\text{OP address}) \\ &= 0.1 \times (268435456) + 0.0 \\ &= 26843545.5(\mu\text{m}) \end{aligned}$$

(3) The upper/lower limit values of the positioning address calculated are within the range of Condition 2.

Hence, the positioning range [-26843545.6 (μm) to 26843545.5 (μm)]

calculated in Condition 1 can be used in the absolute position detection system.

Positioning outside of the range -26843545.6 (μm) to 26843545.5 (μm) cannot be used in the absolute position detection system.

**Example 2.**

(1) Using Expression 1, calculate the positioning address which can be specified in the system where the OP address in Example 1 is 214740000.0 (μm).

- Lower limit value of positioning address

$$\begin{aligned} \text{(Positioning address)} &= 0.1 \times (-268435456) + 214740000.0 \\ &= 187896454.4 \text{ (}\mu\text{m)} \end{aligned}$$

- Upper limit value of positioning address

$$\begin{aligned} \text{(Positioning address)} &= 0.1 \times 268435455 + 214740000.0 \\ &= 241583545.5 \text{ (}\mu\text{m)} \end{aligned}$$

(2) Since the lower limit value of the positioning address calculated is within the range of Condition 2, the calculated address 187896454.4 (μm) is the lower limit for positioning in the absolute position detection system.

Since the upper limit of the positioning address calculated is outside of the range of Condition 2, the upper limit value 214748364.7 (μm) is the upper limit for positioning in the absolute position detection system.

In the absolute position detection system, use the positioning address within the range 187896454.4 (μm) to 214748364.7 (μm).

Positioning in excess of 187896454.4 (μm) cannot be used in the absolute position detection system.

**Example 3.**

(1) There are the following conditions to calculate the positioning address:

- Movement amount per pulse: 0.9 (μm)
- OP address: 0.0 (μm)
- Feedback pulses = 8192 (pulse)

(2) Calculate the positioning address from the output pulse count using range in Condition 1 and the positioning address calculation expression (Expression 1).

- Lower limit value of positioning address (the number of negative pulses in Condition 1 is used for calculation)

$$\begin{aligned} \text{(Positioning address)} &= (\text{Movement amount per pulse}) \\ &\quad \times (\text{number of output pulses}) + (\text{OP address}) \\ &= 0.9 \times (-268435456) + 0.0 \\ &= -241591910.4 \text{ (}\mu\text{m)} \end{aligned}$$

- Upper limit value of positioning address (the number of positive pulses in Condition 1 is used for calculation)

$$\begin{aligned} \text{(Positioning address)} &= (\text{Movement amount per pulse}) \\ &\quad \times (\text{number of output pulses}) + (\text{OP address}) \\ &= 0.9 \times 268435455 + 0.0 \\ &= 241591909.5 \text{ (}\mu\text{m)} \end{aligned}$$

- (3) Since the upper/lower limit values of the positioning address calculated are outside of the range of Condition 2, use the positioning address within the positioning range of Condition 2 (-214748364.8( $\mu\text{m}$ ) to 214748364.7( $\mu\text{m}$ )).

## 2. Concept for the unit of degree

- The positioning address is within the range  $0^\circ$  to  $359.99999^\circ$  at the position to which a machine OPR was made.  
When the OP position is not  $0^\circ$ , the range is also  $0^\circ$  to  $359.99999^\circ$ .
- For positioning in the same direction, control from maximum to minimum (for address increase:  $359.99999^\circ$  to  $0^\circ$ /for address decrease:  $0^\circ$  to  $359.99999^\circ$ ) cannot be exercised. (See below)

- When positioning is to be used in the absolute position detection system, set the upper/lower limit values of the software stroke limit within the range  $0^\circ$  to  $359.99999^\circ$ .

## 12.7 Other functions

Other functions include the "step function", "skip function", "M code output function", "teaching function", "command in-position function", "acceleration/deceleration processing function", "pre-reading start function", "deceleration start flag function" and "stop command processing for deceleration stop function". Each function is executed by parameter setting or sequence program creation and writing.

### 12.7.1 Step function

The "step function" is used to confirm each operation of the positioning control one by one.

It is used in debugging work for major positioning control, etc.

A positioning operation in which a "step function" is used is called a "step operation". In step operations, the timing for stopping the control can be set. (This is called the "step mode".) Control stopped by a step operation can be continued by setting "step continue" (to continue the control)" in the "step start information".

The details shown below explain about the "step function".

- [1] Relation between the step function and various controls
- [2] Step mode
- [3] Step start information
- [4] Using the step operation
- [5] Control details
- [6] Control precautions
- [7] Setting method

#### [1] Relation between the step function and various controls

The following table shows the relation between the "step function" and various controls.

| Control type              |                                                                      |                                                 | Step function | Step applicability          |
|---------------------------|----------------------------------------------------------------------|-------------------------------------------------|---------------|-----------------------------|
| OPR control               | Machine OPR control                                                  |                                                 | ×             | Step operation not possible |
|                           | Fast OPR control                                                     |                                                 | ×             |                             |
| Major positioning control | Position control                                                     | 1-axis linear control                           | ○             | Step operation possible     |
|                           |                                                                      | 2- to 4-axis linear interpolation control       | ○             |                             |
|                           |                                                                      | 1-axis fixed-feed control                       | ○             |                             |
|                           |                                                                      | 2- to 4-axis fixed-feed control (interpolation) | ○             |                             |
|                           |                                                                      | 2-axis circular interpolation control           | ○             |                             |
|                           |                                                                      | 3-axis helical interpolation control            | ○             |                             |
|                           | 1- to 4-axis Speed control                                           |                                                 | ×             | Step operation not possible |

|                           | Other control                                                        | Current value changing                          | ○             |                             |
|                           |                                                                      | JUMP instruction, NOP instruction, LOOP to LEND | ×             | Step operation not possible |
| Manual control            | JOG operation, Inching operation                                     |                                                 | ×             | Step operation not possible |
|                           | Manual pulse generator operation                                     |                                                 | ×             |                             |

○ : Set when required. × : Setting not possible

**[2] Step mode**

In step operations, the timing for stopping the control can be set. This is called the "step mode". (The "step mode" is set in the control data " [Cd.34](#) Step mode".)

The following shows the two types of "step mode" functions.

**(1) Deceleration unit step**

The operation stops at positioning data requiring automatic deceleration. (A normal operation will be carried out until the positioning data requiring automatic deceleration is found. Once found, that positioning data will be executed, and the operation will then automatically decelerate and stop.)

**(2) Data No. unit step**

The operation automatically decelerates and stops for each positioning data. (Even in continuous path control, an automatic deceleration and stop will be forcibly carried out.)

**[3] Step start information**

Control stopped by a step operation can be continued by setting "step continue" (to continue the control) in the "step start information". (The "step start information" is set in the control data " [Cd.36](#) Step start information".)

The following table shows the results of starts using the "step start information" during step operation.

| Stop status in the step operation      | <a href="#">Md.26</a> Axis operation status | <a href="#">Cd.36</a> Step start information | Step start results                     |
|----------------------------------------|---------------------------------------------|----------------------------------------------|----------------------------------------|
| 1 step of positioning stopped normally | Step standby                                | 1: Step continue                             | The next positioning data is executed. |

The warnings "Step not possible" (warning code: 511) will occur and the step operation will not be continued if the " [Md.26](#) Axis operation status" is other than "Step standby" or the step valid flag is OFF when step start information is set.

#### [4] Using the step operation

The following shows the procedure for checking positioning data using the step operation.

Write "1" (carry out step operation) in "[Cd.35]Step valid flag".

Set in "[Cd.34]Step mode".

Write "1" (restart) to "[Cd.6]Restart command" and check whether the positioning data operates normally.

Write "1" (step continue) to "[Cd.36]Step start information", and check whether the next positioning data operates normally.

Write "0" (carry out no step operation) in "[Cd.35]Step valid flag".

## [5] Control details

- (1) The following drawing shows a step operation during a "deceleration unit step".

Fig. 12.41 Operation during step execution by deceleration unit step

- (2) The following drawing shows a step operation during a "data No. unit step".

Fig. 12.42 Operation during step execution positioning data No. unit step

**[6] Control precautions**

- (1) When step operation is carried out using interpolation control positioning data, the step function settings are carried out for the reference axis.
- (2) When the step valid flag is ON, the step operation will start from the beginning if the positioning start signal is turned ON while " [Md.26](#) Axis operation status" is "Step standby". (The step operation will be carried out from the positioning data set in " [Cd.3](#) Positioning start No.".)

**[7] Setting method**

To use the "step function", write the data shown in the following table to the QD75 using the sequence program. Refer to section [4] "Using the step operation" for the timing of the settings.

The set details are validated when written to the QD75.

| Setting item          |                        | Setting value | Setting details                                             | Buffer memory address |        |        |        |
|-----------------------|------------------------|---------------|-------------------------------------------------------------|-----------------------|--------|--------|--------|
|                       |                        |               |                                                             | Axis 1                | Axis 2 | Axis 3 | Axis 4 |
| <a href="#">Cd.34</a> | Step mode              | →             | Set "0: Deceleration unit step" or "1: Data No. unit step". | 1544                  | 1644   | 1744   | 1844   |
| <a href="#">Cd.35</a> | Step valid flag        | 1             | Set "1: Carry out step operation".                          | 1545                  | 1645   | 1745   | 1845   |
| <a href="#">Cd.36</a> | Step start information | →             | Set "1: Step continue", depending on the stop status.       | 1546                  | 1646   | 1746   | 1846   |

\* Refer to Section 5.7 "List of control data" for details on the setting details.

## 12.7.2 Skip function

The "skip function" is used to stop (deceleration stop) the control of the positioning data being executed at the time of the skip signal input, and execute the next positioning data.

A skip is executed by a skip command ([Cd.37] Skip command) or external command signal.

The "skip function" can be used during control in which positioning data is used.

The details shown below explain about the "skip function".

[1] Control details

[2] Control precautions

[3] Setting the skip function from the CPU module

[4] Setting the skip function using an external command signal

### [1] Control details

The following drawing shows the skip function operation.

Fig. 12.43 Operation when a skip signal is input during positioning control

### [2] Control precautions

- (1) If the skip signal is turned ON at the last of an operation, a deceleration stop will occur and the operation will be terminated.
- (2) When a control is skipped (when the skip signal is turned ON during a control), the positioning complete signals (X14, X15, X16, X17) will not turn ON.
- (3) When the skip signal is turned ON during the dwell time, the remaining dwell time will be ignored, and the next positioning data will be executed.
- (4) When a control is skipped during interpolation control, the reference axis skip signal is turned ON. When the reference axis skip signal is turned ON, a deceleration stop will be carried out for every axis, and the next reference axis positioning data will be executed.
- (5) The M code ON signals (X4, X5, X6, X7) will not turn ON when the M code output is set to the AFTER mode (when "1: AFTER mode" is set in " [Pr.18] M code ON signal output timing").  
(In this case, the M code will not be stored in " [Md.25] Valid M code".)
- (6) The skip cannot be carried out by the speed control and position-speed switching control.
- (7) If the skip signal is turned ON with the M code signal turned ON, the transition to the next data is not carried out until the M code signal is turned OFF.

### [3] Setting the skip function from the CPU module

The following shows the settings and sequence program example for skipping the control being executed in axis 1 with a command from the CPU module.

(1) Set the following data.

(The setting is carried out using the sequence program shown below in section (2)).

| Setting item              | Setting value | Setting details        | Buffer memory address |        |        |        |
|---------------------------|---------------|------------------------|-----------------------|--------|--------|--------|
|                           |               |                        | Axis 1                | Axis 2 | Axis 3 | Axis 4 |
| <b>Cd.37</b> Skip command | 1             | Set "1: Skip request". | 1547                  | 1647   | 1747   | 1847   |

\* Refer to Section 5.7 "List of control data" for details on the setting details.

(2) Add the following sequence program to the control program, and write it to the CPU module.

- 1) When the "skip command" is input, the value "1" (skip request) set in "**Cd.37** Skip command" is written to the QD75 buffer memory (1547).

#### Example

\*

\* No.19 Skip program

\*

#### [4] Setting the skip function using an external command signal

The skip function can also be executed using an "external command signal".

The following shows the settings and sequence program example for skipping the control being executed in axis 1 using an "external command signal".

- (1) Set the following data to execute the skip function using an external command signal.

(The setting is carried out using the sequence program shown below in section (2)).

| Setting item                                     | Setting value | Setting details                     | Buffer memory address |        |        |        |
|--------------------------------------------------|---------------|-------------------------------------|-----------------------|--------|--------|--------|
|                                                  |               |                                     | Axis 1                | Axis 2 | Axis 3 | Axis 4 |
| <b>Pr.42</b> External command function selection | 3             | Set "3: Skip request".              | 62                    | 212    | 362    | 512    |
| <b>Cd.8</b> External command valid               | 1             | Set "1: Validate external command". | 1505                  | 1605   | 1705   | 1805   |

\* Refer to Section 5.7 "List of control data" for details on the setting details.

- (2) Add the following sequence program to the control program, and write it to the CPU module.

## 12.7.3 M code output function

The "M code output function" is used to command sub work (clamping, drill rotation, tool replacement, etc.) related to the positioning data being executed.

When the M code ON signal (X4, X5, X6, X7) is turned ON during positioning execution, a No. called the M code is stored in " [Md.25] Valid M code".

These " [Md.25] Valid M code" are read from the CPU module, and used to command auxiliary work. M codes can be set for each positioning data. (Set in setting item " [Da.10] M code" of the positioning data.)

The timing for outputting (storing) the M codes can also be set in the "M code output function".

The details shown below explain about the "M code output function".

- [1] M code ON signal output timing
- [2] M code OFF request
- [3] Control precautions
- [4] Setting method
- [5] Reading M codes

## [1] M code ON signal output timing

The timing for outputting (storing) the M codes can be set in the "M code output function". (The M code is stored in " [Md.25] Valid M code" when the M code ON signal is turned ON.)

The following shows the two types of timing for outputting M codes: the "WITH" mode and the "AFTER" mode.

## (1) WITH mode

The M code ON signal (X4, X5, X6, X7) is turned ON at the positioning start, and the M code is stored in " [Md.25] Valid M code".

Fig. 12.44 M code ON/OFF timing (WITH mode)

(2) AFTER mode

The M code ON signal (X4, X5, X6, X7) is turned ON at the positioning completion, and the M code is stored in " **[Md.25]** Valid M code".

Fig. 12.45 M code ON/OFF timing (AFTER mode)

[2] M code OFF request

When the M code ON signal (X4, X5, X6, X7) is ON, it must be turned OFF by the sequence program.

To turn OFF the M code ON signal, set "1" (turn OFF the M code signal) in " **[Cd.7]** M code OFF request".

| Setting item                     | Setting value | Setting details                         | Buffer memory address |        |        |        |
|----------------------------------|---------------|-----------------------------------------|-----------------------|--------|--------|--------|
|                                  |               |                                         | Axis 1                | Axis 2 | Axis 3 | Axis 4 |
| <b>[Cd.7]</b> M code OFF request | 1             | Set "1: Turn OFF the M code ON signal". | 1504                  | 1604   | 1704   | 1804   |

\* Refer to Section 5.7 "List of control data" for details on the setting details.

The next positioning data will be processed as follows if the M code ON signal is not turned OFF. (The processing differs according to the " **[Da.1]** Operation pattern".)

| <b>[Da.1]</b> Operation pattern |                                                        | Processing                                                                                                                                                                                  |
|---------------------------------|--------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 00                              | Independent positioning control (Positioning complete) | The next positioning data will not be executed until the M code ON signal is turned OFF.                                                                                                    |
| 01                              | Continuous positioning control                         |                                                                                                                                                                                             |
| 11                              | Continuous path control                                | The next positioning data will be executed. If the M code is set to the next positioning data, a warning "M code ON signal ON start" (warning code: 503) will occur. (Refer to Fig. 12.46.) |

Fig. 12.46 Warning due to an M code ON signal during continuous path control

**POINT**

If the M code output function is not required, set a "0" in setting item " [Da.10] M code" of the positioning data.

**[3] Control precautions**

- (1) During interpolation control, the reference axis M code ON signal is turned ON.
- (2) The M code ON signal will not turn ON if "0" is set in " [Da.10] M code".  
(The M code will not be output, and the previously output value will be held in " [Md.25] Valid M code".)
- (3) If the M code ON signal is ON at the positioning start, an error "M code ON signal start" (error code: 536) will occur, and the positioning will not start.
- (4) If the PLC READY signal (Y0) is turned OFF, the M code ON signal will turn OFF and "0" will be stored in " [Md.25] Valid M code".
- (5) If the positioning operation time is short during continuous path control, there will not be enough time to turn OFF the M code ON signal, and a warning "M code ON signal ON" (warning code: 503) may occur. In this case, set a "0" in the " [Da.10] M code" of that section's positioning data.
- (6) In the AFTER mode during speed control, the M code is not output and the M code ON signal does not turn ON.
- (7) If current value changing where "9003" has been set to " [Cd.3] Positioning start No." is performed, the M code output function is made invalid.

#### [4] Setting method

The following shows the settings to use the "M code output function".

- (1) To specify the M code ON signal output timing for each positioning data  
Use "[Da.27] M code ON signal output timing".

The following shows the settings to use "[Da.27] M code ON signal output timing".

- Set the M code No. in the positioning data "[Da.10] M code".
- Set the timing to output the M code ON signal [X4, X5, X6, X7] in the positioning data "[Da.27] M code ON signal output timing".

- (2) To set the same M code ON signal output timing for all positioning data  
Setting "[Pr.18] M code ON signal output timing" enables batch specification of M code ON signal output timing for each positioning data. Set 0 in "[Da.27] M code ON signal output timing" when using "[Pr.18] M code ON signal output timing". When a value other than 0 is set, "[Da.27] M code ON signal output timing" will be valid. (The setting in "[Pr.18] M code ON signal output timing" becomes valid on the rising edge (OFF to ON) of the PLC READY signal [Y0].)

The following shows the settings to use "[Pr.18] M code ON signal output timing".

- Set the M code No. in the positioning data "[Da.10] M code".
- Set "0: Use the set value in "[Pr.18] M code ON signal output timing". (initial value) in the positioning data "[Da.27] M code ON signal output timing".
- Set the timing to output the M code ON signal [X4, X5, X6, X7] in the detailed parameter "[Pr.18] M code ON signal output timing".

| Setting item |                                | Setting value | Setting details                                                                                                                                                         | Buffer memory address    |                          |                           |                           |
|--------------|--------------------------------|---------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------|--------------------------|--------------------------|---------------------------|---------------------------|
|              |                                |               |                                                                                                                                                                         | Axis 1                   | Axis 2                   | Axis 3                    | Axis 4                    |
| [Pr.18]      | M code ON signal output timing | →             | Set the timing to output the M code ON signal.<br>0: WITH mode<br>1: AFTER mode                                                                                         | 27                       | 177                      | 327                       | 477                       |
| [Da.27]      | M code ON signal output timing | →             | Set the M code ON signal output timing for each positioning data.<br>0: Use the set value in "[Pr.18] M code ON signal output timing".<br>1: WITH mode<br>2: AFTER mode | 2003 + N*1<br>(b0 to b1) | 8003 + N*1<br>(b0 to b1) | 14003 + N*1<br>(b0 to b1) | 20003 + N*1<br>(b0 to b1) |

\*1 N indicates the offset address of each positioning data.

$N = ((\text{Positioning data No.}) - 1) \times 10$

\* Refer to Section 5.2 "List of parameters" for the information on detail settings.

## [5] Reading M codes

"M codes" are stored in the following buffer memory when the M code ON signal turns ON.

| Monitor item | Monitor value | Storage details                                                                | Buffer memory address |        |        |        |
|--------------|---------------|--------------------------------------------------------------------------------|-----------------------|--------|--------|--------|
|              |               |                                                                                | Axis 1                | Axis 2 | Axis 3 | Axis 4 |
| <b>Md.25</b> | Valid M code  | → The M code No. ( <b>Da.10</b> M code) set in the positioning data is stored. | 808                   | 908    | 1008   | 1108   |

\* Refer to Section 5.6 "List of monitor data" for information on the storage details.

The following shows a sequence program example for reading the " **Md.25** Valid M code" to the CPU module data register (D110). (The read value is used to command the sub work.)

Read M codes not as "rising edge commands", but as "ON execution commands".

### 12.7.4 Teaching function

The "teaching function" is used to set addresses aligned using the manual control (JOG operation, inching operation, and manual pulse generator operation) in the positioning data addresses ("Da.6" Positioning address/movement amount", "Da.7" Arc address").

The details shown below explain about the "teaching function".

- [1] Control details
- [2] Control precautions
- [3] Data used in teaching
- [4] Teaching procedure
- [5] Teaching program example

#### [1] Control details

##### (1) Teaching timing

Teaching is executed using the sequence program when the BUSY signal (XC, XD, XE, XF) is OFF. (During manual control, teaching can be carried out as long as the axis is not BUSY, even when an error or warning has occurred.)

##### (2) Addresses for which teaching is possible

The addresses for which teaching is possible are "current feed values" (Md.20 Current feed value) having the OP as a reference. The settings of the "movement amount" used in incremental system positioning cannot be used. In the teaching function, these "current feed values" are set in the "Da.6" Positioning address/movement amount" or "Da.7" Arc address".

##### (3) Dedicated instructions "ZP.TEACH 1, ZP.TEACH 2, ZP.TEACH 3, ZP.TEACH 4, ZP.PFWRT"

When the dedicated instructions "ZP.TEACH 1, ZP.TEACH 2, ZP.TEACH 3, ZP.TEACH 4, ZP.PFWRT" are used to execute the teaching function, the programming becomes easier. Refer to CHAPTER 14 "DEDICATED INSTRUCTIONS" for details.

## [2] Control precautions

- (1) Before teaching, a "machine OPR" must be carried out to establish the OP.  
(When a current value changing, etc., is carried out, " [Md.20] Current feed value" may not show absolute addresses having the OP as a reference.)
- (2) Teaching cannot be carried out for positions to which movement cannot be executed by manual control (positions to which the workpiece cannot physically move). (During center point designation circular interpolation control, etc., teaching of " [Da.7] Arc address" cannot be carried out if the center point of the arc is not within the moveable range of the workpiece.)
- (3) Writing to the flash ROM can be executed up to 100,000 times.  
If writing to the flash ROM exceeds 100,000 times, the writing may become impossible (assured value is up to 100,000 times).  
If the error "Flash ROM write number error" (error code: 805) occurs when writing to the flash ROM has been completed, check whether or not the program is created so as to write continuously to the flash ROM.

## [3] Data used in teaching

The following control data is used in teaching.

| Setting item |                               | Setting value | Setting details                                                                                                                                                       | Buffer memory address |        |        |        |
|--------------|-------------------------------|---------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------|-----------------------|--------|--------|--------|
|              |                               |               |                                                                                                                                                                       | Axis 1                | Axis 2 | Axis 3 | Axis 4 |
| [Cd.1]       | Flash ROM write request       | 1             | Write the set details to the flash ROM (backup the changed data).                                                                                                     | 1900                  |        |        |        |
| [Cd.38]      | Teaching data selection       | →             | Sets to which "current feed value" is written.<br>0: Written to " [Da.6] Positioning address/movement amount".<br>1: Written to " [Da.7] Arc address".                | 1548                  | 1648   | 1748   | 1848   |
| [Cd.39]      | Teaching positioning data No. | →             | Designates the data to be taught.<br>(Teaching is carried out when the setting value is 1 to 600.)<br>When teaching has been completed, this data is cleared to zero. | 1549                  | 1649   | 1749   | 1849   |

\* Refer to Section 5.7 "List of control data" for details on the setting details.

#### [4] Teaching procedure

The following shows the procedure for a teaching operation.

- (1) When teaching to the " [Da.6] Positioning address/movement amount"  
(Teaching example on axis 1)

- (2) When entering teaching data into " Da.7 Arc address" and then into " Da.6 Positioning address/movement amount" (Teaching example for 2-axis circular interpolation control with sub point designation on axes 1 and 2)

## [Motion path]

### [5] Teaching program example

The following shows a sequence program example for setting (writing) the positioning data obtained with the teaching function to the QD75.

#### (1) Setting conditions

- When setting the current feed value as the positioning address, write it when the BUSY signal is OFF.

#### (2) Program example

- The following example shows a program to carry out the teaching of axis 1 by the dedicated instruction "ZP.TEACH 1".

- 1) Move the workpiece to the target position using a JOG operation (or an inching operation, a manual pulse generator operation).

2) Carry out the teaching operation with the following program.

#### Example

\*  
 \* No.19 Teaching program  
 \*  
 \*       •Position to the target position with manual operation.  
 \*  
 \*  
 \*

#### POINT

- (1) Confirm the teaching function and teaching procedure before setting the positioning data.
- (2) The positioning addresses that are written are absolute address (ABS) values.
- (3) If the positioning operation is correctly completed with the written positioning data, it is recommended that the positioning data be registered in the QD75 flash ROM.

### 12.7.5 Command in-position function

The "command in-position function" checks the remaining distance to the stop position during the automatic deceleration of positioning control, and set a flag to 1. This flag is called the "command in-position flag". The command in-position flag is used as a front-loading signal indicating beforehand the completion of the position control.

The details shown below explain about the "command in-position function".

- [1] Control details
- [2] Control precautions
- [3] Setting method
- [4] Confirming the command in-position flag

#### [1] Control details

The following shows control details of the command in-position function.

- (1) When the remaining distance to the stop position during the automatic deceleration of positioning control becomes equal to or less than the value set in " **Pr.16** Command in-position width", "1" is stored in the command in-position flag (**Md.31** Status: b2).

(Command in-position width check)

Remaining distance  $\leq$  " **Pr.16** Command in-position width" setting value

Fig. 12.47 Command in-position operation

- (2) A command in-position width check is carried out every 0.9ms (QD75P□N/QD75D□N) or 1.8ms (QD75P□/QD75D□).

## [2] Control precautions

(1) A command in-position width check will not be carried out in the following cases.

- During speed control
- During speed control in speed-position switching control
- During speed control in position-speed switching control

Fig. 12.48 Command in-position width check

(2) The command in-position flag will be turned OFF in the following cases.

("0" will be stored in " [Md.31] Status: b2".)

- At the positioning control start
- At the speed control start
- At the speed-position switching control, position-speed switching control start
- At the OPR control start
- At the JOG operation start
- At the inching operation start
- When the manual pulse generator operation is enabled.

(3) The " [Pr.16] Command in-position width" and command in-position flag ([Md.31] Status: b2) of the reference axis are used during interpolation control. When the " [Pr.20] Interpolation speed designation method" is "Composite speed", the command in-position width check is carried out in the remaining distance on the composite axis (line/arc connecting the start point address and end point address).

## [3] Setting method

To use the "command in-position function", set the required value in the parameter shown in the following table, and write it to the QD75.

The set details are validated at the rising edge (OFF → ON) of the PLC READY signal (Y0).

| Setting item |                           | Setting value | Setting details                                                                                                    | Factory-set initial value |
|--------------|---------------------------|---------------|--------------------------------------------------------------------------------------------------------------------|---------------------------|
| Pr.16        | Command in-position width | →             | Turn ON the command in-position flag, and set the remaining distance to the stop position of the position control. | 100                       |

\* Refer to Section 5.2 "List of parameters" for setting details.

## [4] Confirming the command in-position flag

The "command in-position flag" is stored in the following buffer memory.

| Monitor item | Monitor value | Storage details | Buffer memory address                                        |        |        |        |
|--------------|---------------|-----------------|--------------------------------------------------------------|--------|--------|--------|
|              |               |                 | Axis 1                                                       | Axis 2 | Axis 3 | Axis 4 |
| Md.31        | Status        | →               | The command in-position flag is stored in the "b2" position. |        |        |        |
|              |               |                 | 817                                                          | 917    | 1017   | 1117   |

\* Refer to Section 5.6 "List of monitor data" for information on the storage details.

**REMARK**

- Parameters are set for each axis.
- It is recommended that the parameters be set whenever possible with GX Configurator-QP. Execution by sequence program uses many sequence programs and devices. The execution becomes complicated, and the scan times will increase.

### 12.7.6 Acceleration/deceleration processing function

The "acceleration/deceleration processing function" adjusts the acceleration/deceleration of each control to the acceleration/deceleration curve suitable for devices.

Setting the acceleration/deceleration time changes the slope of the acceleration/deceleration curve.

The following two methods can be selected for the acceleration/deceleration curve:

- Trapezoidal acceleration/deceleration
- S-curve acceleration/deceleration

The details shown below explain about the "acceleration/deceleration processing function".

[1] "Acceleration/deceleration time 0 to 3" control details and setting

[2] "Acceleration/deceleration method setting" control details and setting

#### [1] "Acceleration/deceleration time 0 to 3" control details and setting

In the QD75, four types each of acceleration time and deceleration time can be set. By using separate acceleration/deceleration times, control can be carried out with different acceleration/deceleration times for positioning control, JOG operation, OPR, etc.

Set the required values for the acceleration/deceleration time in the parameters shown in the following table, and write them to the QD75.

The set details are validated when written to the QD75.

| Setting item |                     | Setting value | Setting details                                                          | Factory-set initial value |
|--------------|---------------------|---------------|--------------------------------------------------------------------------|---------------------------|
| Pr.9         | Acceleration time 0 | →             | Set the acceleration time at a value within the range of 1 to 8388608ms. | 1000                      |
| Pr.25        | Acceleration time 1 | →             |                                                                          | 1000                      |
| Pr.26        | Acceleration time 2 | →             |                                                                          | 1000                      |
| Pr.27        | Acceleration time 3 | →             |                                                                          | 1000                      |
| Pr.10        | Deceleration time 0 | →             | Set the deceleration time at a value within the range of 1 to 8388608ms. | 1000                      |

\* Refer to Section 5.2 "List of parameters" for setting details.

## [2] "Acceleration/deceleration method setting" control details and setting

In the "acceleration/deceleration method setting", the acceleration/deceleration processing method is selected and set. The set acceleration/deceleration processing is applied to all acceleration/deceleration (except for inching operation and manual pulse generator operation).

The two types of "acceleration/deceleration method setting" are shown below.

### (1) Trapezoidal acceleration/deceleration processing method

This is a method in which linear acceleration/deceleration is carried out based on the acceleration time, deceleration time, and speed limit value set by the user.

Fig. 12.49 Trapezoidal acceleration/deceleration processing method

### (2) S-curve acceleration/deceleration processing method

In this method, the motor burden is reduced during starting and stopping.

This is a method in which acceleration/deceleration is carried out gradually, based on the acceleration time, deceleration time, speed limit value, and " Pr.35 S-curve ratio" (1 to 100%) set by the user.

When the stepping motor is used, the acceleration around the inflection point on the s shape is faster compared with the trapezoidal acceleration/deceleration. This may cause step-out. \*1

In this case, adjust the acceleration/deceleration time to decrease the acceleration around the inflection point, or use a servo motor.

\*1: When comparing the trapezoidal acceleration/deceleration and S-curve acceleration/deceleration processing method in the same acceleration/deceleration time.

Fig. 12.50 S-curve acceleration/deceleration processing method

When a speed change request or override request is given during S-curve acceleration/deceleration processing, S-curve acceleration/deceleration processing begins at the start of a speed change request or an override request.

Fig. 12.51 Speed change during S-curve acceleration/deceleration processing

Set the required values for the "acceleration/deceleration method setting" in the parameters shown in the following table, and write them to the QD75. The set details are validated when written to the QD75.

| Setting item                                      | Setting value | Setting details                                                                                                                                     | Factory-set initial value |
|---------------------------------------------------|---------------|-----------------------------------------------------------------------------------------------------------------------------------------------------|---------------------------|

| Pr.35 S-curve ratio                               | →             | Set the acceleration/deceleration curve when "1" is set in " Pr.34 Acceleration/deceleration processing selection".                                 | 100                       |

\* Refer to Section 5.2 "List of parameters" for setting details.

#### REMARK

- Parameters are set for each axis.
- It is recommended that the parameters be set whenever possible with GX Configurator-QP. Execution by sequence program uses many sequence programs and devices. The execution becomes complicated, and the scan times will increase.

## 12.7.7 Pre-reading start function

The "pre-reading start function" does not output pulses while the execution prohibition flag is ON if a positioning start request is given with the execution prohibition flag ON, and starts outputting pulses within 1.3ms (QD75P□N/QD75D□N) or 3ms (QD75P□/QD75D□) after OFF of the execution prohibition flag is detected. The positioning start request is given when the axis is in a standby status, and the execution prohibition flag is turned OFF at the axis operating timing. This shortens the virtual start time. The QD75 normally takes 1.5 to 2.0ms (QD75P□N/QD75D□N) or 6 to 7ms (QD75P□/QD75D□) from when it receives a positioning start request until it starts pulse output (start time). Some systems often need the start time to be shortened. This "pre-reading start function" can improve the tact time of the system.

The "pre-reading start function" will be explained below.

- [1] Control details
- [2] Control precautions
- [3] Program examples

## [1] Control details

The pre-reading start function is performed by turning ON the positioning start signal [Y10, Y11, Y12, Y13] with the execution prohibition flag [Y14, Y15, Y16, Y17] ON, or by executing the dedicated instruction (ZP.PSTRT1, ZP.PSTRT2, ZP.PSTRT3, ZP.PSTRT4). However, if positioning is started with the execution prohibition flag ON, the positioning data is analyzed but pulse output is not provided. While the execution prohibition flag is ON, " [Md.26] Axis operation status" remains unchanged from "5: Analyzing". Pulse output starts within 1.3ms (QD75P□N/QD75D□N) or 3ms (QD75P□/QD75D□) after the execution prohibition flag [Y14, Y15, Y16, Y17] has turned OFF, and " [Md.26] Axis operation status" changes to the status (e.g. "Position control", "Speed control") that matches the control system. (Refer to Fig. 12.52)

Fig. 12.52 Operations of pre-reading start function

The pre-reading start function is effective for the system as shown below.

Fig. 12.53 System example using pre-reading start function

Fig. 12.53 shows a system example which repeats:

- 1) Feeding a stock with a feed shaft; and
- 2) Cutting it with a cutter

to cut the stock to fixed size. The operations of the feed shaft and cutter shaft are represented as shown in Fig. 12.54.

Fig. 12.54 Operation timings of system example

The cutter shaft starts from the moment the feed shaft has completed feeding the stock "①", and the feed shaft starts from the moment the cutter shaft has returned to the standby position "②". Actually, however, there is a delay of start time  $T_s$  (1.5 to 2.0ms (QD75P□N/QD75D□N) or 6 to 7ms (QD75P□/QD75D□)) from when the QD75 receives a start request until it outputs pulses. The system's tact time can be reduced by the shortening of this delay with the Pre-reading start function.

In Fig. 12.54, the feed shaft stands by during the stop time  $T_w$ .

Hence, pre-reading of the next data starts during the stop time  $T_w$ . If  $T_w$  is a certain period of time, the analysis of the next data is completed during that period, and the system is placed in an execution prohibition flag OFF waiting status. Therefore, replacing the positioning start timing at ② with the execution prohibition flag OFF allows the time from when the axis operation request turns ON until pulse output starts to be reduced to within 1.3ms (QD75P□N/QD75D□N) or 3ms (QD75P□/QD75D□) in the sequence program. (Refer to Fig. 12.52.)

## [2] Control precautions

- (1) The time required to analyze the positioning data is up to 7ms.
- (2) After positioning data analysis, the system is put in an execution prohibition flag OFF waiting status. Any change made to the positioning data in the execution prohibition flag OFF waiting status is not reflected on the positioning data. Change the positioning data before turning ON the positioning start signal.
- (3) The pre-reading start function is invalid if the execution prohibition flag is turned OFF between when the positioning start signal has turned ON and when positioning data analysis is completed ( $T_a < \text{start time}$ ,  $T_a$ : Refer to Fig. 12.52).
- (4) The data No. which can be executed positioning start using "Cd.3 Positioning start No." with the pre-reading start function are No. 1 to 600 only. Performing the pre-reading start function at the setting of No. 7000 to 7004 or 9001 to 9004 will result in an error "Outside start No. range" (error code: 543).
- (5) Always turn ON the execution prohibition flag at the same time or before turning ON the positioning start signal. Pre-reading may not be started if the execution prohibition flag is turned ON during  $T_a$  after the positioning start signal is turned ON. The pre-reading start function is invalid if the execution prohibition flag is turned ON after positioning start (pulse output) with the execution prohibition flag OFF. (It is made valid at the next positioning start.)

## [3] Program examples

## 12.7.8 Deceleration start flag function

The "deceleration start flag function" turns ON the flag when the constant speed status or acceleration status switches to the deceleration status during position control whose operation pattern is "Positioning complete". This function can be used as a signal to start the operation to be performed by other equipment at each end of position control or to perform preparatory operation, etc. for the next position control.

For the "deceleration start flag function", the following will be explained.

- [1] Control details
- [2] Control precautions
- [3] Setting method
- [4] Checking of deceleration start flag

## [1] Control details

When deceleration for a stop is started in the position control whose operation pattern is "Positioning complete", "1" is stored into " Md.48 Deceleration start flag". When the next operation start is made or the manual pulse generator operation enable status is gained, "0" is stored. (Refer to Fig. 12.55.)

(1) Start made with positioning data No. specified

Fig. 12.55 Operation of deceleration start flag

## (2) Block start

At a block start, this function is valid for only the position control whose operation pattern is "Positioning complete" at the point whose shape has been set to "End". (Refer to Fig. 12.56.)

The following table indicates the operation of the deceleration start flag in the case of the following block start data and positioning data.

| Block start data | Da.11<br>Shape | Da.12<br>Start data No. | Da.13<br>Special start instruction |
|------------------|----------------|-------------------------|------------------------------------|
| 1st point        | 1: Continue    | 1                       | 0: Block start                     |
| 2nd point        | 1: Continue    | 3                       | 0: Block start                     |
| 3rd point        | 0: End         | 4                       | 0: Block start                     |
| •                |                |                         |                                    |
| •                |                |                         |                                    |

| Positioning Data No. | Da.1<br>Operation pattern          |
|----------------------|------------------------------------|
| 1                    | 01: Continuous positioning control |
| 2                    | 00: Positioning complete           |
| 3                    | 00: Positioning complete           |
| 4                    | 11: Continuous path control        |
| 5                    | 00: Positioning complete           |
| •                    |                                    |
| •                    |                                    |

Fig. 12.56 Operation of deceleration start flag at block start

## [2] Control precautions

- (1) The deceleration start flag function is valid for the control system of "1-axis linear control", "2-axis linear interpolation control", "3-axis linear interpolation control", "4-axis linear interpolation control", "speed-position switching control" or "position-speed switching control". (In the case of linear interpolation control, the function is valid for only the reference axis.) Refer to Section 3.2.4 "Combination of QD75 main functions and sub functions".
- (2) The deceleration start flag does not turn ON when the operation pattern is "continuous positioning control" or "continuous path control".
- (3) The deceleration start flag function is invalid for an OPR, JOG operation, inching operation, manual pulse generator operation, and deceleration made with a stop signal.
- (4) The deceleration start flag does not turn ON when a speed change or override is used to make deceleration.
- (5) If a target position change is made while the deceleration start flag is ON, the deceleration start flag remains ON.

- (6) When the movement direction is reversed by a target position change, the deceleration start flag turns ON.

- (7) During position control of position-speed switching control, the deceleration start flag is turned ON by automatic deceleration. The deceleration start flag remains ON if position control is switched to speed control by the position-speed switching signal after the deceleration start flag has turned ON.
- (8) If the condition start of a block start is not made since the condition is not satisfied, the deceleration start flag turns ON when the shape is "End".
- (9) When a continuous operation interrupt request is issued, the deceleration start flag turns ON at a start of deceleration in the positioning data being executed.

## [3] Setting method

To use the "deceleration start flag function", set "1" to the following control data using a sequence program.

The set data is made valid on the rising edge (OFF to ON) of the PLC READY signal [Y0].

| Setting item |                               | Setting value | Setting details                                                                                                                                      | Buffer memory address |
|--------------|-------------------------------|---------------|------------------------------------------------------------------------------------------------------------------------------------------------------|-----------------------|
| <b>Cd.41</b> | Deceleration start flag valid | →             | Set whether the deceleration start flag function is made valid or invalid.<br>0: Deceleration start flag invalid<br>1: Deceleration start flag valid | 1905                  |

\* Refer to Section 5.7 "List of control data" for details on the setting details.

## [4] Checking of deceleration start flag

The "deceleration start flag" is stored into the following buffer memory addresses.

| Monitor item |                         | Monitor value | Storage details                                                                         | Buffer memory address |        |        |        |
|--------------|-------------------------|---------------|-----------------------------------------------------------------------------------------|-----------------------|--------|--------|--------|
|              |                         |               |                                                                                         | Axis 1                | Axis 2 | Axis 3 | Axis 4 |
| Md.48        | Deceleration start flag | →             | 0: Status other than below<br>1: Status from deceleration start to next operation start | 899                   | 999    | 1099   | 1199   |

\* Refer to Section 5.6 "List of monitor data" for information on the storage details.

### 12.7.9 Stop command processing for deceleration stop function

The "stop command processing for deceleration stop function" is provided to set the deceleration curve if a stop cause occurs during deceleration stop processing (including automatic deceleration).

This function is valid for both trapezoidal and S-curve acceleration/deceleration processing methods.

(For the stop cause, refer to Section 1.2.3 Outline of stopping.)

The "stop command processing for deceleration stop function" performs the following two operations:

- (1) **Deceleration curve re-processing**  
Re-processes a deceleration curve starting from the speed at stop cause occurrence to stop, according to the preset deceleration time.
- (2) **Deceleration curve continuation**  
Continues the current deceleration curve after a stop cause has occurred.

This section explains the "stop command processing for deceleration stop function" as follows:

- [1] Control details
- [2] Control precautions
- [3] Setting method

#### [1] Control details

The operation of "stop command processing for deceleration stop function" is explained below.

##### (1) Deceleration curve re-processing

A deceleration curve is re-processed starting from the speed at stop cause occurrence to stop, according to the preset deceleration time.

If a stop cause occurs during automatic deceleration of position control, the deceleration stop processing stops as soon as the target has reached the positioning address specified in the positioning data that is currently executed.

Fig. 12.57 Deceleration curve re-processing operation (for position control or S-curve acceleration/deceleration processing)

**(2) Deceleration curve continuation**

The current deceleration curve is continued after a stop cause has occurred.

If a stop cause occurs during automatic deceleration of position control, the deceleration stop processing may be complete before the target has reached the positioning address specified in the positioning data that is currently executed.

Fig. 12.58 Deceleration curve continuation operation (for position control or S-curve acceleration/deceleration processing)

**[2] Control precautions**

- (1) In manual control (JOG operation, inching operation, manual pulse generator operation), the stop command processing for deceleration stop function is invalid.
- (2) The stop command processing for deceleration stop function is valid when "0: Normal deceleration stop" is set in " [Pr.37](#) Stop group 1 sudden stop selection" to " [Pr.39](#) Stop group 3 sudden stop selection" as the stopping method for stop cause occurrence.
- (3) The stop command processing for deceleration stop function is invalid when "1: Sudden stop" is set in " [Pr.37](#) Stop group 1 sudden stop selection" to " [Pr.39](#) Stop group 3 sudden stop selection". (A deceleration curve is re-processed, according to the " [Pr.36](#) Sudden stop deceleration time" (starting from the speed at stop cause occurrence to a stop))  
In the position control (including position control of speed/position changeover control or position/speed changeover control) mode, positioning may stop immediately depending on the stop cause occurrence timing and " [Pr.36](#) Sudden stop deceleration time" setting.

Fig. 12.59 Sudden stop operation (for position control or S-curve acceleration/deceleration processing)

## [3] Setting method

To use the "stop command processing for deceleration stop function", set the following control data in a sequence program.

The set data are made valid as soon as they are written to the buffer memory.

The PLC READY signal [Y0] is irrelevant.

| Setting item |                                                         | Setting value | Setting details                                                                                                                              | Buffer memory address |
|--------------|---------------------------------------------------------|---------------|----------------------------------------------------------------------------------------------------------------------------------------------|-----------------------|
| Cd.42        | Stop command processing for deceleration stop selection | →             | Set the stop command processing for deceleration stop function.<br>0: Deceleration curve re-processing<br>1: Deceleration curve continuation | 1907                  |

\* For details of the setting details, refer to "Section 5.7 Control data list".

# CHAPTER 13 COMMON FUNCTIONS

The details and usage of the "common functions" executed according to the user's requirements are explained in this chapter.

Common functions include functions required when using the QD75, such as parameter initialization and execution data backup.

Read the setting and execution procedures for each common function indicated in this chapter thoroughly, and execute the appropriate function where required.

|      |                                                   |     |   |
|------|---------------------------------------------------|-----|---|
| 13.1 | Outline of common functions.....                  | 13- | 2 |
| 13.2 | Parameter initialization function .....           | 13- | 3 |
| 13.3 | Execution data backup function .....              | 13- | 5 |
| 13.4 | External I/O signal logic switching function..... | 13- | 7 |
| 13.5 | External I/O signal monitor function .....        | 13- | 8 |

## 13.1 Outline of common functions

"Common functions" are executed according to the user's requirements, regardless of the control system, etc. These common functions are executed by peripheral devices or using sequence programs.

The following table shows the functions included in the "common functions".

| Common function                              | Details                                                                                                                                                                                                                                                                                                             | Means            |                    |
|----------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|------------------|--------------------|
|                                              |                                                                                                                                                                                                                                                                                                                     | Sequence program | Peripheral devices |
| Parameter initialization function            | This function returns the parameter stored in the QD75 buffer memory and flash ROM to the factory-set initial value.                                                                                                                                                                                                | ○                | ○                  |

\* For the QD75P□/QD75D□, this function is available in GX Developer (SW6D5C-GPPW-E or later).

For the QD75P□N/QD75D□N, external I/O signals cannot be monitored on GX Developer. Use the system monitor of GX Works2.

## 13.2 Parameter initialization function

The "parameter initialization function" is used to return the setting data set in the QD75 buffer memory and flash ROM to their factory-set initial values.

The details shown below explain about the "parameter initialization function".

[1] Parameter initialization means

[2] Control details

[3] Control Precautions

[4] Parameter initialization method

### [1] Parameter initialization means

- Initialization is executed with a sequence program.
- Initialization is executed by peripheral device.

Refer to GX Configurator-QP Operating Manual for the execution method by peripheral device.

### [2] Control details

The following table shows the setting data initialized by the "parameter initialization function".

(The data initialized are "buffer memory" and " flash ROM " setting data.)

| Setting data                                            |
|---------------------------------------------------------|
| Basic parameters (Pr.1 to Pr.10)                        |
| Detailed parameters<br>(Pr.11 to Pr.42, Pr.70 , Pr.150) |
| OPR basic parameters (Pr.43 to Pr.48)                   |
| OPR detailed parameters (Pr.49 to Pr.57)                |
| Positioning data (No.1 to No.600)                       |
| Block start data (No.7000 to No.7004)                   |

### [3] Control Precautions

- (1) Parameter initialization is only executed when the positioning control is not carried out (when the PLC READY signal (Y0) is OFF).  
The warning "In PLC READY" (warning code: 111) will occur if executed when the PLC READY [Y0] is ON.
- (2) Writing to the flash ROM can be executed up to 100,000 times.  
If writing to the flash ROM exceeds 100,000 times, the writing may become impossible, and the error "Flash ROM write error" (error code: 801) will occur.
- (3) A "CPU module reset" or "CPU module power restart" must be carried out after the parameters are initialized.
- (4) If an error occurs on the parameter set in the QD75 when the PLC READY signal [Y0] is turned ON, the QD75 READY signal [X0] will not be turned ON and the control cannot be carried out.

**Important**

Parameter initialization takes about 10 seconds. (Up to 30 seconds are sometimes required.)

Do not turn the power ON/OFF; reset the CPU module, etc., during parameter initialization. If the power is turned OFF or the CPU module is reset to forcibly end the process, the data backed up in the flash ROM will be lost.

**[4] Parameter initialization method**

(1) Parameter initialization is carried out using the dedicated instruction "ZP.PINIT".

(Refer to CHAPTER 14 "DEDICATED INSTRUCTIONS" for details.)

(2) Parameter initialization can also be carried out by the writing of the data shown in the table below to the buffer memory using the TO instruction /intelligent function device.

The initialization of the parameter is executed at the time point the data is written to the QD75 buffer memory.

| Setting item                                 | Setting value | Setting details                             | Buffer memory address |        |        |        |
|----------------------------------------------|---------------|---------------------------------------------|-----------------------|--------|--------|--------|
|                                              |               |                                             | Axis 1                | Axis 2 | Axis 3 | Axis 4 |
| <b>Cd.2</b> Parameter initialization request | 1             | Set "1" (parameter initialization request). | 1901                  |        |        |        |

\* Refer to Section 5.7 "List of control data" for details on the setting details.

When the initialization is complete, "0" will be set in " **Cd.2** Parameter initialization request" by the QD75 automatically.

13.3 Execution data backup function

When the QD75 buffer memory data is rewritten from the CPU module, "the data backed up in the QD75 flash ROM" may differ from "the data (buffer memory data) for which control is being executed".

In cases like these, the data being executed will be lost when the programmable controller power is turned OFF. (Refer to CHAPTER 7 "MEMORY CONFIGURATION AND DATA PROCESS")

In cases like these, the "execution data backup function" backs up the data being executed by writing it to the flash ROM. The data that was backed up is then written to the buffer memory when the power is turned ON next.

The details shown below explain about the "execution data backup function".

- [1] Execution data backup means
- [2] Control details
- [3] Control Precautions
- [4] Execution data backup method

[1] Execution data backup (written to flash ROM) means

- The backup is executed with a sequence program.
- The backup is executed by peripheral device.

Refer to GX Configurator-QP Operating Manual for execution data backup method by peripheral device.

[2] Control details

The following shows the data that can be written to the flash ROM using the "execution data backup function".

[3] Control Precautions

- (1) Parameter initialization is only executed when the positioning control is not carried out (when the PLC READY signal (Y0) is OFF). The warning "In PLC READY" (warning code: 111) will occur if executed when the PLC READY [Y0] is ON.
- (2) Writing to the flash ROM can be executed up to 100,000 times. If writing to the flash ROM exceeds 100,000 times, the writing may become impossible, and the error "Flash ROM write error" (error code: 801) will occur.
- (3) After one power ON/CPU module reset operation, writing to the flash ROM using a sequence program is limited to up to 25 times. If the 26th writing is executed, the error "Flash ROM write number error" (error code: 805) will occur. If this error occurs, carry out the power OFF→ON/CPU module reset operation again. Refer to Md.19 of Section 5.1.7 "Types and roles of monitor data" for details.

|                                                                                                                                      |
|--------------------------------------------------------------------------------------------------------------------------------------|
| <b>Important</b>                                                                                                                     |
| If the power is turned OFF or the CPU module is reset to forcibly end the process, the data backed up in the flash ROM will be lost. |

## [4] Execution data backup method

- (1) Execution data backup (writing to the flash ROM) is carried out using the dedicated instruction "PFWRT". (Refer to CHAPTER 14 "DEDICATED INSTRUCTIONS" for details.)
- (2) Refer to Section 7.2 "Data transmission process" for the data transmission processing at the backup of the execution data.
- (3) Execution data backup can also be carried out by the writing of the data shown in the table below to the QD75 buffer memory using the TO instruction /intelligent function device.

The writing to the flash ROM is executed at the time point the data is written to the QD75 buffer memory.

| Setting item                                                                               | Setting value | Setting details                    | Buffer memory address |        |        |        |
|--------------------------------------------------------------------------------------------|---------------|------------------------------------|-----------------------|--------|--------|--------|
|                                                                                            |               |                                    | Axis 1                | Axis 2 | Axis 3 | Axis 4 |
| <span style="border: 1px solid black; padding: 0 2px;">Cd.1</span> Flash ROM write request | 1             | Set "1" (flash ROM write request). | 1900                  |        |        |        |

\* Refer to Section 5.7 "List of control data" for details on the setting details.

When the writing to the flash ROM is complete, "0" will be set in " Cd.1 Flash ROM write request" by the QD75 automatically.

### 13.4 External I/O signal logic switching function

This function switches the signal logic according to the external equipment connected to the QD75.

For the system in which drive unit READY with b-contact, upper limit switch, and lower limit switch are not used, the parameter logic setting can be controlled without wiring if it is changed to a "positive logic".

When the drive unit READY, upper limit switch, and lower limit switch are used, ensure to use them with b-contact.

The details shown below explain about the "external I/O signal logic switching function".

[1] Parameter setting details

[2] Precautions on parameter setting

#### [1] Parameter setting details

To use the "external I/O signal logic switching function", set the parameters shown in the following table.

| Setting item |                               | Setting details                                                     |                                | Factory-set initial value | Buffer memory address |        |        |        |                                         |                                         |
|--------------|-------------------------------|---------------------------------------------------------------------|--------------------------------|---------------------------|-----------------------|--------|--------|--------|-----------------------------------------|-----------------------------------------|
|              |                               |                                                                     |                                |                           | Axis 1                | Axis 2 | Axis 3 | Axis 4 |                                         |                                         |
| Pr.22        | Input signal logic selection  | • Selection of logic of signals input from external source to QD75  |                                | 0                         | 31                    | 181    | 331    | 481    |                                         |                                         |

\* Refer to Section 5.2 "List of parameters" for the information on detail settings.

#### [2] Precautions on parameter setting

- (1) The external I/O signal logic switching parameters are validated when the PLC READY signal [Y0] is turned OFF to ON. (The logic is negative right after power-on.)
- (2) If each signal logic is set erroneously, the operation may not be carried out correctly.  
Before setting, check the specifications of the equipment to be used.

## 13.5 External I/O signal monitor function

The "external I/O signal monitor function" monitors the module's information and external I/O signal monitor information in the module's detailed information which can be displayed on the system monitor of GX Developer\*1.

The information that can be monitored are the module's information (same as the QD75 front "RUN", "ERR" LED indicators) and the following external I/O signals. (Set the logic of the external I/O signals in " [Pr.22](#) Input signal logic selection" and " [Pr.23](#) Output signal logic selection".)

\*1: For the QD75P□/QD75D□, this function is available in GX Developer (SW6D5C-GPPW-E or later). For details, refer to GX Developer Operating Manual.

For the QD75P□N/QD75D□N, external I/O signals cannot be monitored on GX Developer. Use the system monitor of GX Works2. For details on the system monitor of GX Works2, refer to GX Works2 Version 1 Operating Manual (Common).

# CHAPTER 14 DEDICATED INSTRUCTIONS

The QD75 dedicated instructions are explained in this chapter.

These instructions are used to facilitate the programming for the use of the functions of the intelligent function module.

Using the dedicated instructions, the programming can be carried out without being aware of the QD75 buffer memory address and interlock signal.

|      |                                                          |        |

## 14.1 List of dedicated instructions

The dedicated instructions explained in this Chapter are listed in Table 14.1.

Table 14.1 List of dedicated instructions

| Application                   | Dedicated instruction | Outline of functions                                                                                             | Reference    |
|-------------------------------|-----------------------|------------------------------------------------------------------------------------------------------------------|--------------|
| Absolute position restoration | Z.ABRST1              | This function restores the absolute position of the designated axis of the QD75.                                 | Section 14.3 |
|                               | Z.ABRST2              |                                                                                                                  |              |
|                               | Z.ABRST3              |                                                                                                                  |              |
|                               | Z.ABRST4              |                                                                                                                  |              |
| Positioning start             | ZP.PSTR1              | This function starts the positioning control of the designated axis of the QD75.                                 | Section 14.4 |
|                               | ZP.PSTR2              |                                                                                                                  |              |
|                               | ZP.PSTR3              |                                                                                                                  |              |
|                               | ZP.PSTR4              |                                                                                                                  |              |
| Teaching                      | ZP.TEACH1             | This function carries out teaching the designated axis of the QD75.                                              | Section 14.5 |
|                               | ZP.TEACH2             |                                                                                                                  |              |
|                               | ZP.TEACH3             |                                                                                                                  |              |
|                               | ZP.TEACH4             |                                                                                                                  |              |
| Writing to flash ROM          | ZP.PFWRT              | This function writes the buffer memory parameters, positioning data and block start data to the flash ROM.       | Section 14.6 |
| Parameter initialization      | ZP.PINIT              | This function initializes the buffer memory and flash ROM setting data to the factory-set data (initial values). | Section 14.7 |

## 14.2 Interlock during dedicated instruction is executed

The absolute position restoration instruction (Z.ABRST□), positioning start instruction (ZP.PSTR□) and teaching instruction (ZP.TEACH□) cannot be executed simultaneously in each axis. If they are executed at the same time, the second and later instructions are ignored by an internal interlock (no error will occur).

The timing of the positioning start dedicated instruction (ZP.PSTR□) is as shown below.

## 14.3 Z.ABRST1, Z.ABRST2, Z.ABRST3, Z.ABRST4

These dedicated instructions restore the absolute position of the designated axis.

| Setting data | Usable device   |      |               |                        |      |                                   |                   |          |        |
|--------------|-----------------|------|---------------|------------------------|------|-----------------------------------|-------------------|----------|--------|
|              | Internal device |      | File register | Link direct device J□□ |      | Intelligent function module U□\G□ | Index register Zn | Constant | Others |
|              | Bit             | Word |               | Bit                    | Word |                                   |                   | K, H     |        |
| (S)          | —               | ○    |               | —                      |      |                                   |                   | —        | —      |
| (D)          | ○               | ○    | —             | —                      |      |                                   |                   | —        | —      |

\*1 If the originating station is a Basic model QCPU (function version B or later), universal model QCPU, or safety CPU, "" (double quotation) of the first argument can be omitted.

When Z.ABRST1, Z.ABRST2, Z.ABRST3, and Z.ABRST4 are common to each other, they are designated as "Z.ABRST□".

## [Setting data]

| Setting data | Setting details                                                                                                                                                                                     | Setting side (*1) | Data type   |
|--------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-------------------|-------------|
| "Un"         | QD75 head I/O number<br>(00 to FE: High-order two digits of I/O number expressed in three digits)                                                                                                   | User              | BIN 16 bits |
| (S)          | Head number of a device in which control data is stored                                                                                                                                             | —                 | Device name |
| (D)          | Head number of a bit device which turns ON the operation by one scan at the time of completion of the instruction.<br>If the instruction is completed abnormally, ((D) + 1) will also be turned ON. | System            | Bit         |

Note) The file register of each of the local device and the program cannot be used as a device for setting data.

\*1: The data on the setting side is as follows.

- User : Data before the execution of dedicated instructions is stored by user.
- System : Data after the execution of dedicated instruction is stored by CPU module.

| (S)+5 to (S)+7 | System area                           | —                                                                                                                                                                                                                                                                               | —                             | —                 |

\*1: The data on the setting side is as follows.

- User : Data before the execution of dedicated instructions is stored by user.
- System : Data after the execution of dedicated instruction is stored by CPU module.

\*2: Refer to Section 15.3 for error codes at abnormal completion.

## [Functions]

- (1) The positioning data is read from the servo amplifier capable of processing the absolute positions of the axes to be set (See below), and the values converted with respect to a unit are stored in " **[Md.20]** Current feed value" and " **[Md.21]** Machine feed value" area of the QD75.
- Z.ABRST1: Axis 1
  - Z.ABRST2: Axis 2
  - Z.ABRST3: Axis 3
  - Z.ABRST4: Axis 4

For absolute position detection system, carry out the absolute position restoration operation each time the power is turned ON or CPU module is reset.

- (2) An I/O module is used for communication (data read/write) with the servo amplifier capable of processing the absolute positions.

When using the Z.ABRST□, prepare the input/output with the following number of points, for each axis, for communication with the servo amplifier.

- Input : 3 points
- Output : 3 points

Refer to Section 12.6 for wiring of I/O signals.

- (3) The Z.ABRST□ instruction completion can be confirmed using the complete devices ((D)+0) and ((D)+1).

- (a) Complete device ((D)+0)

This device is turned ON by the END processing of the scan for which Z.ABRST□ instruction is completed, and turned OFF by the next END processing.

- (b) Complete state display device ((D)+1)

This device is turned ON and OFF according to the state in which Z.ABRST□ instruction is completed.

- When completed normally : Kept unchanged at OFF.
- When completed abnormally : This device is turned ON by the END processing of the scan for which Z.ABRST□ instruction is completed, and turned OFF by the next END processing (same ON/OFF operation as complete device).

The completion of absolute position restoration can be confirmed using the ((S)+4) "status".

- (4) Using the Z.ABRST□ instruction, the absolute position restoration is carried out in the following procedure.

#### [Errors]

- (1) When a dedicated instruction is completed abnormally, the error complete signal ((D)+1) is turned ON, and the error code is stored in the complete status ((S)+1). Check and take a measure against the error referring to Section 15.3 "List of error codes".

#### [Precautions]

- (1) After the absolute position detection system is configured, the absolute position restoration must be carried out at least once after the power is turned ON or reset. Unless the absolute position restoration of the QD75 is completed, the servo amplifier will not be turned ON.
- (2) Execute absolute position restoration when the PLC READY signal [Y0] is OFF.
- (3) The restoration of the absolute position (Z.ABRST□ instruction execution) can also be carried out when the servo amplifier is turned ON. If this is carried out, however, the servo ON signal is turned OFF for approx. 60ms + scan time (servo OFF) and the motor may move.  
When carrying out the absolute position restoration during servo OFF, install an electromagnetic brake and output the Z.ABRST□ instruction to that brake during the Z.ABRST□ instruction execution.
- (4) The following dedicated instructions cannot be executed simultaneously for the same axis.  
(Can be executed simultaneously for different axes.)
  - Positioning start instructions (ZP.PSTRT1 to ZP.PSTRT4)
  - Absolute position restoration instructions (Z.ABRST1 to Z.ABRST4)
  - Teaching instructions (ZP.TEACH1 to ZP.TEACH4)
- (5) When the remote I/O station\* (Q Corresponding MELSECNET/H network remote I/O module) is used, the dedicated instruction (Z.ABRST□) is unusable.  
(For the sequence program example of when the dedicated instruction is not used, refer to the "Absolute Position Detection System" Installation Guide of the Mitsubishi Electric General-Purpose AC Servo.)  
\*: For details of the remote I/O station, refer to Q Corresponding MELSECNET/H Network System Reference Manual (Remote I/O Network).

- [Program examples]

The X47 to X49 and Y50 to Y52 are used for communication with the servo amplifier.

X47: ABS data bit 0  
X48: ABS data bit 1  
X49: Transmission data READY flag  
Y50: Servo ON signal  
Y51: ABS transfer mode  
Y52: ABS request flag

## 14.4 ZP.PSTRT1, ZP.PSTRT2, ZP.PSTRT3, ZP.PSTRT4

These dedicated instructions are used to start the positioning of the designated axis.

| Setting data | Usable device   |      |               |                        |      |                                  |                   |          |        |

| (S)+0  | System area     | —                                                                                                                                                                                                                                                                                   | —                                        | —                 |
| (S)+1  | Complete status | The state at the time of completion is stored.<br>• 0 : Normal completion<br>• Other than 0: Abnormal completion (error code)(*2)                                                                                                                                                   | —                                        | System            |
| (S)+2  | Start No.       | The following data Nos. to be started by the ZP.PSTRT□ instruction are designated.<br>• Positioning data No. : 1 to 600<br>• Block start : 7000 to 7004<br>• Machine OPR : 9001<br>• Fast OPR : 9002<br>• Current value changing : 9003<br>• Multiple axes simultaneous start: 9004 | 1 to 600<br>7000 to 7004<br>9001 to 9004 | User              |

\*1: The data on the setting side is as follows.

- User : Data before the execution of dedicated instructions is stored by user.
- System : Data after the execution of dedicated instruction is stored by CPU module.

\*2: Refer to Section 15.3 for error codes at abnormal completion.

## [Functions]

- (1) The positioning start of the axes to be processed (See below) is carried out.
  - ZP.PSTRT1: Axis 1
  - ZP.PSTRT2: Axis 2
  - ZP.PSTRT3: Axis 3
  - ZP.PSTRT4: Axis 4
- (2) The block start, OPR start, current value changing, and multiple axes simultaneous start can be carried out by the setting of "start number" 7000 to 7004/9001 to 9004 in ((S)+2).
- (3) The ZP.PSTRT□ instruction completion can be confirmed using the complete devices ((D)+0) and ((D)+1).
  - (a) Complete device ((D)+0)  
This device is turned ON by the END processing of the scan for which ZP.PSTRT□ instruction is completed, and turned OFF by the next END processing.
  - (b) Complete state display device ((D)+1)  
This device is turned ON and OFF according to the state in which ZP.PSTRT□ instruction is completed.
    - When completed normally : Kept unchanged at OFF.
    - When completed abnormally : This device is turned ON by the END processing of the scan for which ZP.PSTRT□ instruction is completed, and turned OFF by the next END processing (same ON/OFF operation as complete device).

### [Errors]

- (1) When an ZP.PSTRT□ instruction is completed abnormally, the error complete signal ((D)+1) is turned ON, and the error code is stored in the complete status ((S)+1).  
Check and take a measure against the error referring to Section 15.3 "List of error codes".

### [Precautions]

- (1) When positioning is started by the ZP.PSTRT□ instruction, the positioning start signals (Y10 to Y13) will not turn ON.  
Therefore, the start complete signal (X10 to X13) cannot be used for confirming completion of start of positioning.  
To confirm that positioning control is being executed, use the ZP.PSTRT□ start command or BUSY signals (XC to XF).
- (2) If, after positioning has been started by the ZP.PSTRT□ instruction, a stop command is input before positioning is complete, the complete device (D) turns ON one scan and the execution of the ZP.PSTRT□ instruction is completed.
- (3) The following dedicated instructions cannot be executed simultaneously for the same axis.  
(Can be executed simultaneously for different axes.)
  - Positioning start instructions (ZP.PSTRT1 to ZP.PSTRT4)
  - Absolute position restoration instructions (Z.ABRST1 to Z.ABRST4)
  - Teaching instructions (ZP.TEACH1 to ZP.TEACH4)
- (4) The ZP.PSTRT□ instruction can only be executed when the QD75 READY signal (X0) is turned ON.  
Even if the ZP.PSTRT□ instruction execution request is given when the QD75 READY signal is turned OFF, the ZP.PSTRT□ instruction will not be executed. (not processed.)  
Before executing the ZP.PSTRT□ instruction, turn ON the PLC READY signal (Y0), and turn ON the QD75 READY signal (X0).

- (5) When the remote I/O station\* (Q Corresponding MELSECNET/H network remote I/O module) is used, the dedicated instruction (ZP.PSTRT□) is unusable.  
 \*: For details of the remote I/O station, refer to Q Corresponding MELSECNET/H Network System Reference Manual (Remote I/O Network).
- (6) If the ZP.PSTRT□ instruction is executed in either of the following cases, an error "Dedicated instruction error" (error code: 804) will occur and positioning cannot be started.
- Any value other than 1 to 600, 7000 to 7004, and 9001 to 9004 is set to "Starting number" (device: (S)+2) of the control data.
  - The instruction for a non-existent axis is specified.
- (Example: The ZP.PSTRT2 instruction is specified when the QD75P1 is used.)
- (7) When the multiple axes simultaneous start is executed by ZP.PSTRT□ instruction, the completion device (D) will turn ON when the positioning of the axes executed by ZP.PSTRT□ instructions is completed. (When the instructions is ZP.PSTRT1, the axis will be axis 1.)

### [Program examples]

- The following program executes the positioning start of positioning data No. 1 when X100 turns ON.  
 Use D30 to D32 as the control data devices of positioning data No. 1, and M32 and M200 as the completion devices.

#### (1) Positioning start program

#### (2) Positioning start program (when the dedicated instruction is not used)

## 14.5 ZP.TEACH1, ZP.TEACH2, ZP.TEACH3, ZP.TEACH4

This dedicated instruction is used to teach the designated axis.

| Setting data | Usable device   |      |               |                        |      |                                   |    |          |        |
|--------------|-----------------|------|---------------|------------------------|------|-----------------------------------|----|----------|--------|
|              | Internal device |      | File register | Link direct device J□□ |      | Intelligent function module U□\G□ | Zn | Constant | Others |
|              | Bit             | Word |               | Bit                    | Word |                                   |    | K, H     |        |
| (S)          | —               | ○    |               | —                      |      |                                   |    | —        | —      |
| (D)          | ○               | ○    | —             | —                      |      |                                   |    | —        | —      |

\*1 If the originating station is a Basic model QCPU (function version B or later), universal model QCPU, or safety CPU, "" (double quotation) of the first argument can be omitted.

When ZP.TEACH1, ZP.TEACH2, ZP.TEACH3, and ZP.TEACH4 are common to each other, they are designated as "ZP.TEACH□".

## [Setting data]

| Setting data | Setting details                                                                                                                                                                                     | Setting side (*1) | Data type   |

| (S)+3  | Positioning data No.    | The positioning data No. for which teaching is carried out is set.                                                                                                                                               | 1 to 600      | User              |

\*1: The data on the setting side is as follows.

- User : Data before the execution of dedicated instructions is stored by user.
- System : Data after the execution of dedicated instruction is stored by CPU module.

\*2: Refer to Section 15.3 for error codes at abnormal completion.

## [Functions]

- (1) The "current feed value" of the axes to be set (See below) is set in the positioning address or arc address.  
The positioning data other than the positioning addresses and arc addresses are set by peripheral device or using a sequence program.
  - ZP.TEACH1: Axis 1
  - ZP.TEACH2: Axis 2
  - ZP.TEACH3: Axis 3
  - ZP.TEACH4: Axis 4
- (2) Teaching can be carried out for the positioning data No. 1 to 600.
- (3) The movement of the machine to the address (position) set in the positioning address/arc address of the positioning data is carried out by the JOG operation, inching operation, or manual pulse generator operation.
- (4) The ZP.TEACH□ instruction completion can be confirmed using the complete devices ((D)+0) and ((D)+1).
  - (a) Complete device ((D)+0)  
This device is turned ON by the END processing of the scan for which ZP.TEACH□ instruction is completed, and turned OFF by the next END processing.
  - (b) Complete state display device ((D)+1)  
This device is turned ON and OFF according to the state in which ZP.TEACH□ instruction is completed.
    - When completed normally : Kept unchanged at OFF.
    - When completed abnormally : This device is turned ON by the END processing of the scan for which ZP.TEACH□ instruction is completed, and turned OFF by the next END processing (same ON/OFF operation as complete device).

### [Errors]

- (1) When a ZP.TEACH instruction is completed abnormally, the error complete signal ((D)+1) is turned ON, and the error code is stored in the complete status (S)+1. Check and take a measure against the error referring to Section 15.3 "List of error codes".

### [Precautions]

- (1) The following dedicated instructions cannot be executed simultaneously for the same axis.  
(Can be executed simultaneously for different axes.)
  - Positioning start instructions (ZP.PSTRT1 to ZP.PSTRT4)
  - Absolute position restoration instructions (Z.ABRST1 to Z.ABRST4)
  - Teaching instructions (ZP.TEACH1 to ZP.TEACH4)
- (2) The ZP.TEACH instruction can only be executed when the BUSY signal (XC, XD, XE, XF) is turned OFF.  
When the BUSY signal is turned ON, the ZP.TEACH instruction will not be executed. (not processed.)  
Before executing the ZP.TEACH instruction, make sure that the BUSY signal for the axis to be processed is turned OFF.
- (3) When the remote I/O station\* (Q Corresponding MELSECNET/H network remote I/O module) is used, the dedicated instruction (ZP.TEACH) is unusable.  
\*: For details of the remote I/O station, refer to Q Corresponding MELSECNET/H Network System Reference Manual (Remote I/O Network).
- (4) If the ZP.TEACH instruction is executed in any of the following cases, an error "Dedicated instruction error" (error code: 804) will occur and teaching cannot be performed.
  - Any value other than 0 and 1 is set to "Teaching selection" (device: (S)+2) of the control data.
  - Any value other than 1 to 600 is set to "Positioning No." (device: (S)+3) of the control data.
  - The instruction for a non-existent axis is specified.  
(Example: The ZP.TEACH2 instruction is specified when the QD75P1 is used.)

## [Program example]

Program to execute the teaching of the positioning data No. 3 of the axis 1 when X39 is turned ON.

## (1) Teaching program

Positioning is carried out for a target position by manual operation.

## (2) Teaching program (when the dedicated instruction is not used)

Positioning is carried out for a target position by manual operation.

## 14.6 ZP.PFWRT

These dedicated instructions are used to write the QD75 parameters, positioning data and block start data to the flash ROM.

| Setting data | Usable device   |      |               |                        |      |                                   |                   |          |        |
|--------------|-----------------|------|---------------|------------------------|------|-----------------------------------|-------------------|----------|--------|

|              | Bit             | Word |               | Bit                    | Word |                                   |                   | K, H     |        |
| (S)          | —               | ○    |               | —                      |      |                                   | —                 | —        |        |
| (D)          | ○               | ○    | —             | —                      |      |                                   | —                 | —        |        |

\*1 If the originating station is a Basic model QCPU (function version B or later), universal model QCPU, or safety CPU, "" (double quotation) of the first argument can be omitted.

## [Setting data]

| Setting data | Setting details                                                                                                                                                                                     | Setting side (*1) | Data type   |
|--------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-------------------|-------------|
| "Un"         | QD75 head I/O number<br>(00 to FE: High-order two digits of I/O number expressed in three digits)                                                                                                   | User              | BIN 16 bits |
| (S)          | Head number of a device in which control data is stored                                                                                                                                             | —                 | Device name |
| (D)          | Head number of a bit device which turns ON the operation by one scan at the time of completion of the instruction.<br>If the instruction is completed abnormally, ((D) + 1) will also be turned ON. | System            | Bit         |

Note) The file register of each of the local device and the program cannot be used as a device for setting data.

\*1: The data on the setting side is as follows.

- User : Data before the execution of dedicated instructions is stored by user.
- System : Data after the execution of dedicated instruction is stored by CPU module.

## [Control data]

| Device | Item            | Setting data                                                                                                                   | Setting Range | Setting side (*1) |
|--------|-----------------|--------------------------------------------------------------------------------------------------------------------------------|---------------|-------------------|
| (S)+0  | System area     | —                                                                                                                              | —             | —                 |
| (S)+1  | Complete status | The state at the time of completion is stored.<br>0 : Normal completion<br>Other than 0 : Abnormal completion (error code)(*2) | —             | System            |

\*1: The data on the setting side is as follows.

- User : Data before the execution of dedicated instructions is stored by user.
- System : Data after the execution of dedicated instruction is stored by CPU module.

\*2: Refer to Section 15.3 for error codes at abnormal completion.

**[Functions]**

(1) The ZP.PFWRT instruction completion can be confirmed using the complete devices ((D)+0) and ((D)+1).

(a) Complete device ((D)+0)

This device is turned ON by the END processing of the scan for which ZP.PFWRT instruction is completed, and turned OFF by the next END processing.

(b) Complete state display device ((D)+1)

This device is turned ON and OFF according to the state in which ZP.PFWRT instruction is completed.

- When completed normally : Kept unchanged at OFF.
- When completed abnormally : This device is turned ON by the END processing of the scan for which ZP.PFWRT instruction is completed, and turned OFF by the next END processing (same ON/OFF operation as complete device).

**[Errors]**

(1) When a dedicated instruction is completed abnormally, the error complete signal ((D)+1) is turned ON, and the error code is stored in the complete status ((S)+1). Check and take measures against the error referring to Section 15.3 "List of error codes".

### [Precautions]

- (1) Do not turn ON the power and reset the CPU module while parameters, positioning data and block start data are written to the flash ROM using the ZP.PFWRT instruction.  
A parameter error will occur or normal positioning start will become impossible because the parameters, positioning data and block start data are not written normally to the flash ROM.  
If this occurs, restart the operation by the method shown below.
  - For GX Configurator-QP or GX Works2, write the parameters, positioning data and block start data again to the flash ROM.
  - For a sequence program, write the parameters, positioning data and block start data to the QD75 after initializing the parameters (ZP.PINIT instruction execution and others).  
Then execute the ZP.PFWRT instruction again.
- (2) Writing to the flash ROM can be executed up to 100,000 times.  
If writing to the flash ROM exceeds 100,000 times, the writing may become impossible.
- (3) After the power ON and CPU module reset operation, writing to the flash ROM using a sequence program is limited to up to 25 times. (Not limited to up to 25 times when writing to the flash ROM is carried out by peripheral device.)  
If the 26th or more writing is requested after the power ON/CPU module reset operation, an error "flash ROM write number error" (error code: 805) will occur, and the writing will be disabled. If a flash ROM write error occurs by one writing to the flash ROM, check and correct the flash ROM writing program. Then reset the error or turn ON the power and reset the CPU module again.
- (4) The ZP.PFWRT instruction can only be executed when the QD75 READY signal (X0) is turned OFF.  
When the QD75 READY signal is turned ON, the ZP.PFWRT instruction cannot be executed.  
Before executing the ZP.PFWRT instruction, turn OFF the PLC READY signal (Y0) and then turn OFF the QD75 READY signal.
- (5) When the remote I/O station\* (Q Corresponding MELSECNET/H network remote I/O module) is used, the dedicated instruction (ZP.PFWRT) is unusable.  
\*: For details of the remote I/O station, refer to Q Corresponding MELSECNET/H Network System Reference Manual (Remote I/O Network).

## [Program example]

Program used to write the parameters and positioning data stored in the buffer memory to the flash ROM when X3D is turned ON.

## (1) Flash ROM write program

## [Program example for use when dedicated instruction is not used]

## (2) Flash ROM write program (when the dedicated instruction is not used)

## 14.7 ZP.PINIT

This dedicated instruction is used to initialize the setting data of the QD75.

| Setting data | Usable device   |      |               |                        |      |       |                   |          |        |

| (S)+1  | Complete status | The state at the time of completion is stored.<br>0 : Normal completion<br>Other than 0: Abnormal completion (error code)(*2) | —             | System            |

\*1: The data on the setting side is as follows.

- User : Data before the execution of dedicated instructions is stored by user.
- System : Data after the execution of dedicated instruction is stored by CPU module.

\*2: Refer to Section 15.3 for error codes at abnormal completion.

## [Functions]

- (1) This dedicated instruction is used to return the setting data set in the QD75 buffer memory and flash ROM to their factory-set data (initial values).

|                                     |                                |
|-------------------------------------|--------------------------------|
| Initialized setting data            |                                |
| Parameters                          | (Pr.1 to Pr.57, Pr.70, Pr.150) |
| Positioning data (No. 1 to No. 600) |                                |
| Block start data (No. 7000 to 7004) |                                |

- (2) The ZP.PINIT instruction completion can be confirmed using the complete devices ((D)+0) and ((D)+1).

- (a) Complete device ((D)+0)

This device is turned ON by the END processing of the scan for which ZP.PINIT instruction is completed, and turned OFF by the next END processing.

- (b) Complete state display device ((D)+1)

This device is turned ON and OFF according to the state in which ZP.PINIT instruction is completed.

- When completed normally : Kept unchanged at OFF.
- When completed abnormally : This device is turned ON by the END processing of the scan for which ZP.PINIT instruction is completed, and turned OFF by the next END processing (same ON/OFF operation as complete device).

## [Errors]

- (1) When a dedicated instruction is completed abnormally, the error complete signal ((D)+1) is turned ON, and the error code is stored in the complete status ((S)+1). Check and take measures against the error referring to Section 15.3 "List of error codes".

## [Precautions]

- (1) The ZP.PINIT instruction can only be executed when the QD75 READY signal (X0) is turned OFF.  
When the QD75 READY signal is turned ON, the ZP.PINIT instruction cannot be executed.  
Before executing the ZP.PINIT instruction, turn OFF the PLC READY signal (Y0) and then turn OFF the QD75 READY signal.
- (2) When the remote I/O station\* (Q Corresponding MELSECNET/H network remote I/O module) is used, the dedicated instruction (ZP.PINIT) is unusable.  
\*: For details of the remote I/O station, refer to Q Corresponding MELSECNET/H Network System Reference Manual (Remote I/O Network).

- (3) Writing to the flash ROM can be executed up to 100,000 times.  
If writing to the flash ROM exceeds 100,000 times, the writing may become impossible.
- (4) After the power ON and CPU module reset operation, writing to the flash ROM using a sequence program is limited to up to 25 times. (Not limited to up to 25 times when writing to the flash ROM is carried out by peripheral device.)  
If the 26th or more writing is requested after the power ON/CPU module reset operation, an error "flash ROM write number error" (error code: 805) will occur, and the writing will be disabled. If a flash ROM write error occurs by one writing to the flash ROM, check and correct the flash ROM writing program. Then reset the error or turn ON the power and reset the CPU module again.

## [Program example]

The following program initializes the parameters in buffer memory and flash ROM when X3C turns ON.

## (1) Parameter initialization program

## (2) Parameter initialization program (when the dedicated instruction is not used)

[illegible]

# CHAPTER 15 TROUBLESHOOTING

The "errors" and "warnings" detected by the QD75 are explained in this chapter.

Errors can be confirmed with the QD75 LED display and peripheral devices.  
When an error or warning is detected, confirm the detection details and carry out the required measures.

|      |                                |        |
|------|--------------------------------|--------|
| 15.1 | Troubleshooting .....          | 15- 2  |
| 15.2 | Error and warning details..... | 15- 6  |
| 15.3 | List of errors .....           | 15- 10 |
| 15.4 | List of warnings .....         | 15- 42 |

## 15.1 Troubleshooting

## (1) Troubleshooting using the LEDs

Check items and corrective actions for troubleshooting using the indicator LEDs of the QD75 are described below.

## (a) When the RUN LED turns off

| Check item                               | Action                                                                                                                                                                                     |
|------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Is the power supplied?                   | Check that the voltage supplied to the power supply module is within the rated range.                                                                                                      |
| Is the power supply capacity sufficient? | Calculate the total current consumption of the connected modules (CPU module, I/O modules, and intelligent function modules) and check that the power supply capacity is not insufficient. |
| Is the module connected correctly?       | Check that the module is correctly connected to the base unit.                                                                                                                             |

If there is no problem on the above check items, a watchdog timer error may have occurred. Reset the CPU module and check that the RUN LED turns on.

If not, the possible cause is a hardware failure. Please consult your local Mitsubishi representative.

## (b) When the ERR. LED turns on

| Check item               | Action                                                                                      |
|--------------------------|---------------------------------------------------------------------------------------------|
| Is there a system error? | An error may have occurred in the CPU module. Check the error and take a corrective action. |

## (c) When the ERR. LED and axis LED flash

| Check item              | Action                                                              |
|-------------------------|---------------------------------------------------------------------|
| Is there an axis error? | Check the error code and take the action described in Section 15.3. |

## (d) When all LEDs turn on

Reset the CPU module and check that the module is in the normal status.

If all LEDs still turn on, the possible cause is a hardware failure. Please consult your local Mitsubishi representative.

## (2) Troubleshooting when a motor does not rotate

Check items and corrective actions for troubleshooting when a motor does not rotate are described below.

| POINT                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <p>The following signals must be ON for the QD75 to operate (excluding when the positioning test function of GX Works2 is used).</p> <ul style="list-style-type: none"> <li>• QD75 READY signal (X0)</li> <li>• Drive unit READY signal</li> <li>• Upper limit signal and Lower limit signal</li> </ul> <p>The status of the drive unit READY signal and upper/lower limit signals can be checked in b0 to b2 of " <b>[Md.30]</b> External I/O signal".</p> |

| Check item                                                                                           | Action                                                                                                                                                                          |
|------------------------------------------------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Are the QD75 READY signal (X0), drive unit READY signal, and upper/lower limit signals ON?           | Review and correct the program and wiring so that all the QD75 READY signal (X0), drive unit READY signal, and upper/lower limit signals turn ON.                               |
| Is there an error in the QD75? (ERR. LED is on or flashing)                                          | Check the error code and take a corrective action.                                                                                                                              |
| Is the drive unit powered ON?                                                                        | Power on the drive unit.                                                                                                                                                        |
| Is there an error in the drive unit?                                                                 | Check the error code of the drive unit and take a corrective action.                                                                                                            |
| Is the wiring between the QD75 and drive unit correct?                                               | Check the wiring between the QD75 and drive unit, and correct it.                                                                                                               |
| Is the wiring between the drive unit and motor correct?                                              | Check the wiring between the drive unit and motor, and correct it.                                                                                                              |
| Is the value in " <b>[Md.20]</b> Current feed value" changed after positioning control is performed? | Review the start program.                                                                                                                                                       |
| Is the number of the input pulses for monitoring changed after positioning control is performed? *1  | Refer to the drive unit operating manual and check that the function to suppress the motor rotation is not working.                                                             |
| Isn't the value in " <b>[Md.26]</b> Axis operation status" "1: Stopped"?                             | <ul style="list-style-type: none"> <li>• Review the stop program.</li> <li>• Check that the stop signal (STOP) is not input.</li> </ul>                                         |
| Does the pulse output mode setting meet the specifications of the drive unit?                        | Set the value in " <b>[Pr.5]</b> Pulse output mode" so that it satisfies the specifications of the drive unit.                                                                  |
| Does the output logic setting of the command pulse signal meet the specifications of the drive unit? | Set the value of the logic selection of the command pulse signal ( <b>[Pr.23]</b> Output signal logic selection: b0) so that it satisfies the specifications of the drive unit. |

\*1: This check item applies only for the drive unit having a monitor function for the number of input pulses.

If a motor does not rotate even after the above items are checked, the possible cause is a hardware failure.

Please consult your local Mitsubishi representative.

### (3) Troubleshooting when a motor does not rotate as intended.

Check items and corrective actions for troubleshooting when a motor does not rotate as intended are described below.

#### (a) When a motor rotates only in one direction

| Check item                                                                    | Action                                                                                                                              |
|-------------------------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------|
| Is the wiring correct?                                                        | Check that the signal line of the pulse output (for axis 1, connector pin No. "1A15 to 18") is correctly wired or not disconnected. |
| Does the pulse output mode setting meet the specifications of the drive unit? | Set the value in " <b>Pr.5</b> Pulse output mode" so that it satisfies the specifications of the drive unit.                        |

#### (b) When a motor rotates in the opposite direction

| Check item                                                                                                                                                                    | Action                                                                                                                                                                                |
|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Is the wiring correct?                                                                                                                                                        | Check that the signal line of the pulse output (for axis 1, connector pin No. "1A15 to 18") is wired correctly. (CW and CCW or phase A and phase B should be correctly wired.)        |
| Do the values in " <b>Pr.6</b> Rotation direction setting" and " <b>Pr.23</b> Output signal logic selection (b0: Command pulse signal)" match the settings of the drive unit? | Check that the values in " <b>Pr.6</b> Rotation direction setting" and " <b>Pr.23</b> Output signal logic selection (b0: Command pulse signal)" match the settings of the drive unit. |

## (c) When a motor does not rotate at the set speed

| Check item                                                      | Action                                                                                                                                                                                                                                                                                                                                                                                                                                                |
|-----------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Does the value in "Md.28 Axis feedrate" indicate the set speed? | [When "Md.28 Axis feedrate" indicates the set speed]<br><ul style="list-style-type: none"> <li>• Check that the values in "Pr.2 No. of pulses per rotation", "Pr.3 Movement amount per rotation", and "Pr.4 Unit magnification" meet the system.</li> <li>• When the drive unit has the electronic gear function, check that the settings meet the system.</li> </ul>                                                                                 |
|                                                                 | [When "Md.28 Axis feedrate" does not indicate the set speed]<br><ul style="list-style-type: none"> <li>• Check that the speed is not limited by the value in "Pr.8 Speed limit value".</li> <li>• In the JOG operation, Check that the speed is not limited by the value in "Pr.31 JOG speed limit value".</li> <li>• In the JOG operation, check that Forward/Reverse run JOG start signals (Y8 to YF) do not repeatedly turn ON and OFF.</li> </ul> |

## (d) When the set position is not reached

| Check item                                                                                        | Action                                                                                                                                                                                                                                                                                                                                                                      |
|---------------------------------------------------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Does the value in "Md.20 Current feed value" indicate the intended position when the motor stops? | [When "Md.20 Current feed value" reaches the set position]<br><ul style="list-style-type: none"> <li>• Check that the values in "Pr.2 No. of pulses per rotation", "Pr.3 Movement amount per rotation", and "Pr.4 Unit magnification" meet the system.</li> <li>• When the drive unit has the electronic gear function, check that the settings meet the system.</li> </ul> |
|                                                                                                   | [When "Md.20 Current feed value" does not reaches the set position]<br><ul style="list-style-type: none"> <li>• Check that the motor is not stopped by Axis stop signals (Y4 to Y7) or a stop signal (STOP). If a motor is stopped by them, the value "1: Stopped" is stored in "Md.26 Axis operation status".</li> </ul>                                                   |

## 15.2 Error and warning details

## [1] Errors

## ■ Types of errors

Errors detected by the QD75 include parameter setting range errors and errors at the operation start or during operation.

## (1) Parameter setting range errors

The parameters are checked when the power is turned ON and at the rising edge (OFF → ON) of the PLC READY signal [Y0]. An error will occur if there is a mistake in the parameter setting details at that time.

When this kind of error occurs, the QD75 READY signal does not turn ON. To cancel this kind of error, set the correct value in the parameter for which the error occurred, and then turn ON the PLC READY signal [Y0].

## (2) Errors at the operation start or during operation

These are errors that occur at the operation start or during operation when the positioning control, JOG operation, or inching operation is used. If an axis error occurs during interpolation operation, the error No. will be stored in both the reference axis and the interpolation axis.

Note that, in the following cases (a) and (b), the axis error No. will be stored only in the reference axis during analysis of the positioning data set in each point of the positioning start data table.

(a) When the interpolation axis is BUSY.

(b) When the error occurred in positioning data or parameters unrelated to interpolation control.

If the error occurred at the simultaneous start of a positioning operation, the axis error storage details will differ depending on whether the error occurred before or after the simultaneous start.

- If the error occurred before the simultaneous start (illegal axis No., other axis BUSY, etc.), an error "Error before simultaneous start" (error code: 501) will occur.
- If the error occurred after the simultaneous start (positioning data error, software stroke limit error, etc.), an error code corresponding to the axis in which the error occurred will be stored. Because a simultaneous start cannot be carried out due to this, an error "Simultaneous start not possible" (error code: 532) error code will be stored in all axes in which an error has not occurred.

The axis operation status will be displayed as "error occurring" for axes in which an error occurred.

If an error occurs during operation, any moving axes will deceleration stop, and their operation status will be displayed as "error occurring".

All axes will decelerate to a stop during interpolation operations, even if the error occurs in only one axis.

## (3) Types of error codes

| Error code | Error type                                             |
|------------|--------------------------------------------------------|
| 001 to 009 | Fatal error                                            |
| 100 to 199 | Common error                                           |
| 200 to 299 | Error at OPR or absolute position restoration          |
| 300 to 399 | Error during JOG operation or during inching operation |
| 500 to 599 | Error during positioning operation                     |
| 800 to 899 | I/F (Interface) error                                  |
| 900 to 999 | Error during parameter setting range check             |

### ■ Error storage

When an error occurs, the error detection signal turns ON, and the error code corresponding to the error details is stored in the following buffer memory address ([Md.23] Axis error No.) for axis error No. storage.

| Axis No. | Error detection signal | Buffer memory address |
|----------|------------------------|-----------------------|
| 1        | X8                     | 806                   |
| 2        | X9                     | 906                   |
| 3        | XA                     | 1006                  |
| 4        | XB                     | 1106                  |

A new error code is stored in the buffer memory address ([Md.23] Axis error No.) for axis error storage every time an error occurs.

#### POINT

When any of the following errors is detected, it is stored in the axis error No. of axis 1.  
Error code: 001, 002, 107, 800, 801, 802, 805

## [2] Warnings

### ■ Types of warnings

- (1) Warnings include system warnings and axis warnings.

The types of system warnings are shown below.

- System control data setting warnings  
An axis warning for axis 1 will occur.
- Positioning data setting warnings  
An axis warning for each axis will occur.  
Note that a warning will occur for the reference axis when an interpolation designation or axis setting warning occurs.

- (2) Axis warnings occur due to setting warnings from operations such as positioning operations, JOG operations, manual pulse generator operations, or system errors. They can be canceled by turning ON the "[Cd.5] Axis error reset".

Note that some warnings cannot be canceled unless the cause of the warning is eliminated.

The axis operation status does not change even if an axis warning occurs.

- (3) Types of warning codes

| Warning code | Warning type                                    |
|--------------|-------------------------------------------------|
| 100 to 199   | Common warning                                  |
| 300 to 399   | Warning during JOG operation                    |
| 400 to 499   | Warning during manual pulse generator operation |
| 500 to 599   | Warning during positioning operation            |

### ■ Warning storage

- (1) When an axis warning occurs, the warning code corresponding to the warning details is stored in the following buffer memory ([Md.24] Axis warning No.) for axis warning No. storage.

| Axis No. | Buffer memory address |
|----------|-----------------------|
| 1        | 807                   |
| 2        | 907                   |
| 3        | 1007                  |
| 4        | 1107                  |

- (2) When an axis warning occurs in a positioning operation, etc., "1" is set in bit 9 (b9) of the following buffer memory ([Md.31] Status) for axis status storage.

| Axis No. | Buffer memory address |
|----------|-----------------------|
| 1        | 817                   |
| 2        | 917                   |
| 3        | 1017                  |
| 4        | 1117                  |

### [3] Resetting errors and warnings

Remove the cause of error or warning following the actions described in Section 15.3 and 15.4, before cancel an error or warning state by resetting the error.

### ■ How to clear errors or warnings

An error or warning state is canceled after the following processing has been carried out by setting a "1" in the address [1502 (for axis 1)], [1602 (for axis 2)], [1702 (for axis 3)], and [1802 (for axis 4)] of the buffer memory for axis error resetting ([Cd.5] Axis error reset).

- Axis error detection signal turned OFF
- "[Md.23] Axis error No." cleared
- "[Md.24] Axis warning No." cleared
- Changing of "[Md.26] Axis operation status" from "Error" to "Standby".
- Axis warning detection "[Md.31] Status : b9" turned OFF

### [4] Confirming the error and warning definitions

The error and warning definitions can be confirmed with the error and warning codes. Confirming them requires GX Developer or GX Configurator-QP. For details, refer to GX Developer Operating Manual or GX Configurator-QP Operating Manual. (Refer to Section 15.3 and Section 15.4 for details of the error and warning codes.)

## 15.3 List of errors

The following table shows the error details and remedies to be taken when an error occurs.

| Classification of errors | Error code | Error name                        | Error                                                                                                  | Operation status at error occurrence                                                                                                                                                                                              |  |
|--------------------------|------------|-----------------------------------|--------------------------------------------------------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|--|

## 15.4 List of warnings

The following table shows the warning details and remedies to be taken when a warning occurs.

| Classification of warnings | Warning code | Warning name                    | Warning                                                                             | Operation status at warning occurrence                                                                                                                   |  |
|----------------------------|--------------|---------------------------------|-------------------------------------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------|--|
| —                          | 000          | (Normal status)                 | —                                                                                   | —                                                                                                                                                        |  |
| Common                     | 100          | Start during operation          | The start request is issued while the axis is BUSY.                                 | Continue the operation.                                                                                                                                  |  |
|                            | 102          | Deviation counter clear request | The deviation counter clear request is issued while the axis is BUSY.               | The deviation counter clear request is ignored.                                                                                                          |  |
|                            | 104          | Restart not possible            | The restart command is issued when the axis operation status is not "Stopped".      | Continue the operation.                                                                                                                                  |  |
|                            | 109          | Teaching in BUSY                | The teaching request is issued while the axis is BUSY.                              | The warning is issued for the axis designated at the time of the teaching request.                                                                       |  |
|                            | 110          | Less than minimum speed         | The overridden speed becomes "0".                                                   | The system is controlled with the currently executing unit of 1.                                                                                         |  |
|                            | 111          | In PLC READY                    | The request for writing to the flash ROM is issued when the PLC READY is turned ON. | The warning for axis 1 is issued.                                                                                                                        |  |
|                            | 112          | Illegal override value          | A value other than 1 to 300 is set for the override value.                          | <ul style="list-style-type: none"> <li>Controlled at a setting value of 0 : 100.</li> <li>Controlled at a setting value of 301 or over : 300.</li> </ul> |  |
|                            | 113          | Outside new torque value range  | The new torque value exceeds the torque limit setting value.                        | Set a value smaller than the torque limit setting value to the new torque value.                                                                         |  |
|                            | 114          | Below bias speed                | The command speed is below the bias speed at start.                                 | Operate by the bias speed at start.                                                                                                                      |  |

| Related buffer memory address                                           |              |              |              |  | Set range<br>(Setting with sequence program)                                                                                                                                                                                          | Remedy                                                                                                                                           |

## Appendix 1 Version up of the functions

## Appendix 1.1 Comparison of functions according to function versions

The following tables list the QD75 functions compared according to function versions and the buffer memory for their additional functions.

## (1) Function comparison

○:Available × :Not available

- \*1: For the QD75P□N/QD75D□N, external I/O signals can not be monitored on GX Developer. Use the system monitor of GX Works2.
- \*2: Usable on GX Developer of SW6D5C-GPPW-E or later.
- \*3: Compatible with QCPU of function version B.
- \*4: Supported by the module whose first five digits of SERIAL No. are "03042" or later.
- \*5: Supported by the module whose first five digits of SERIAL No. are "05072" or later.
- \*6: Supported by the module whose first five digits of SERIAL No. are "14032" or later.
- \*7: Supported by the module whose first five digits of SERIAL No. are "14012" or later.
- \*8: Supported by the module whose first five digits of the serial number are "17102" or later. GX Configurator-QP does not support these functions. Only GX Works2 (Version 1.540N or later) supports the functions.

## (2) Additional buffer memory

|                         |             |              |              | Interpolation speed designation method                  |                                                        |

\*1: The listed buffer memory addresses are those of the positioning data No. 1 of each axis.  
For the buffer memory address of other positioning data No., refer to Appendix 3.

## (3) Additional devices

| Device No. | Name   |                            | Used function              |
|------------|--------|----------------------------|----------------------------|
| Y14        | Axis 1 | Execution prohibition flag | Pre-reading start function |
| Y15        | Axis 2 |                            |                            |
| Y16        | Axis 3 |                            |                            |
| Y17        | Axis 4 |                            |                            |

## Appendix 1.2 Precautions for the replacement of the QD75P□/QD75D□ with the QD75P□N/QD75D□N

### (1) Specification differences between the QD75P□N/QD75D□N and the QD75P□/QD75D□

The following table shows the differences. The specifications not listed below are the same for the both models.

| Item                                               |                                                      | QD75P□N/QD75D□N                                                                                                | QD75P□/QD75D□                                                                                            |
|----------------------------------------------------|------------------------------------------------------|----------------------------------------------------------------------------------------------------------------|----------------------------------------------------------------------------------------------------------|
| Max. output pulse                                  |                                                      | 4Mpulse/s<br>(QD75D□N)                                                                                         | 1Mpulse/s<br>(Q75D□)                                                                                     |

## (2) Precaution on the use of sequence programs

The QD75P□N/QD75D□N is upgraded from the QD75P□/QD75D□. Therefore, the recognized sequence programs for the QD75P□/QD75D□ can be applied to the QD75P□N/QD75D□N. Note that specifications such as time takes for start-up and data update cycle are improved. When applying a sequence program to the QD75P□N/QD75D□N, modify the sequence program if necessary, checking the processing timing.

## (3) Transferring the set data of the QD75P□/QD75D□ using GX Works2

When GX Works2 is used, the set data of the QD75P□/QD75D□ can be transferred to the QD75P□N/QD75D□N in the following procedure.

- (a) Saving the set data of the QD75P□/QD75D□ from "Save the Positioning Module Data..."
  - 1) In the project view, select the QD75P□/QD75D□ from where the set data is transferred.
  - 2) Go to [Project] → [Intelligent Function Module] → [Save the Positioning Module Data...].
  - 3) Input the file name, and save the set data.
- (b) Reading the set data to the QD75P□N/QD75D□N from "Read from the Positioning Module Data..."
  - 1) In the project view, select the QD75P□N/QD75D□N to where the saved data is transferred.
  - 2) Go to [Project] → [Intelligent Function Module] → [Read from the Positioning Module Data...].
  - 3) Select the name of the file saved in step (a), and open it. The following window opens.

- 4) Check the data to read and click . The set data is read to the QD75P□N/QD75D□N.

## (4) Precaution on the use of GX Configurator-QP

To use the QD75P□N/QD75D□N with GX Configurator-QP, select the QD75P□/QD75D□ in "Select module type". The QD75P□N/QD75D□N can be used in the same manner as the QD75P□/QD75D□. Note that a speed exceeding 1000000pulse/s cannot be set in the following items when "Pulse" is set in "[Pr.1] Unit setting"). To set a value outside a setting range in GX Configurator-QP, set it through a sequence program or GX Works2 of the version 1.64S or later.

| Setting item                           | Setting range in<br>GX Configurator-QP | Setting range in<br>GX Works2 and sequence programs |
|----------------------------------------|----------------------------------------|-----------------------------------------------------|
| <div>Pr.7</div> Bias speed at start    | 0 to 1000000(pulse/s)                  | 0 to 4000000(pulse/s)                               |
| <div>Pr.8</div> Speed limit value      | [QD75P□N]<br>1 to 200000(pulse/s)      | 1 to 4000000(pulse/s)                               |
| <div>Pr.31</div> JOG speed limit value | [QD75D□N]<br>1 to 1000000(pulse/s)     |                                                     |
| <div>Pr.46</div> OPR speed             | 1 to 1000000(pulse/s)                  |                                                     |
| <div>Pr.47</div> Creep speed           |                                        |                                                     |
| <div>Da.8</div> Command speed          |                                        |                                                     |

## Appendix 4 Connection examples with servo amplifiers manufactured by MITSUBISHI Electric Corporation

### Appendix 4.1 Connection example of QD75D□N and MR-J3-□ A (Differential driver) \*5

#### REMARK

- (1) It is recommended to make differential driver connection since differential driver connection is more excellent than open collector connection in max. output pulse and max. connection distance between servos. (Refer to Section 3.1 "Performance specifications".)
- (2) \*1: The logic for each I/O terminal can be changed with " **Pr.22** Input signal logic selection" and " **Pr.23** Output signal logic selection" in detailed parameters 1. (Negative logic is used for all terminals in the example above.)
- (3) \*2: The QD75D□N upper limit (FLS) and lower limit (RLS) are used in the OPR retry function. Set these signals inside the servo amplifier limit switches.
- (4) \*3: These are limit switches for the servo (for stop).
- (5) \*4: This indicates the distance between the QD75D□N and servo amplifier.
- (6) \*5: When used, check the logic for the QD75D□N and servo amplifier in Section 3.4.1, (2) "Output specifications". The QD75D□N is initially set to negative logic.
- (7) "FA-CBLQ75M2J3(-P) cable" can be used for connecting the QD75D□N and MR-J3-□A.

## Appendix 4.2 Connection example of QD75D□N and MR-H □ A (Differential driver) \*6

### REMARK

- (1) It is recommended to make differential driver connection since differential driver connection is more excellent than open collector connection in max. output pulse and max. connection distance between servos. (Refer to Section 3.1 "Performance specifications".)
- (2) \*1: The logic for each I/O terminal can be changed with " **Pr.22** Input signal logic selection" and " **Pr.23** Output signal logic selection" in detailed parameters 1. (Negative logic is used for all terminals in the example above.)
- (3) \*2: The QD75D□N upper limit (FLS) and lower limit (RLS) are used in the OPR retry function. Set these signals inside the servo amplifier limit switches.
- (4) \*3: These are limit switches for the servo (for stop).
- (5) \*4: Refer to the specification and handling instruction manual of the servo amplifier MR-H for details on connection.
- (6) \*5: This indicates the distance between the QD75D□N and servo amplifier.
- (7) \*6: Use the same logic (positive logic/negative logic) for the QD75D□N and servo amplifier. The QD75D□N is initially set to negative logic.

## Appendix 4.3 Connection example of QD75D□N and MR-J2/J2S- □ A (Differential driver)

\*5

## REMARK

- (1) It is recommended to make differential driver connection since differential driver connection is more excellent than open collector connection in max. output pulse and max. connection distance between servos. (Refer to Section 3.1 "Performance specifications".)
- (2) \*1: The logic for each I/O terminal can be changed with " Pr.22 Input signal logic selection" and " Pr.23 Output signal logic selection" in detailed parameters 1. (Negative logic is used for all terminals in the example above.)
- (3) \*2: The QD75D□N upper limit (FLS) and lower limit (RLS) are used in the OPR retry function. Set these signals inside the servo amplifier limit switches.
- (4) \*3: These are limit switches for the servo amplifier (for stop).
- (5) \*4: This indicates the distance between the QD75D□N and servo amplifier.
- (6) \*5: Use the same logic (positive logic/negative logic) for the QD75D□N and servo amplifier. The QD75D□N is initially set to negative logic.

# Appendix 4.4 Connection example of QD75D□N and MR-C □ A (Differential driver)\*5

## REMARK

- (1) It is recommended to make differential driver connection since differential driver connection is more excellent than open collector connection in max. output pulse and max. connection distance between servos. (Refer to Section 3.1 "Performance specifications".)
- (2) \*1: The logic for each I/O terminal can be changed with " **Pr.22** Input signal logic selection" and " **Pr.23** Output signal logic selection" in detailed parameters 1. (Negative logic is used for all terminals in the example above.)
- (3) \*2: The QD75D□N upper limit (FLS) and lower limit (RLS) are used in the OPR retry function. Set these signals inside the servo amplifier limit switches.
- (4) \*3: These are limit switches for the servo amplifier (for stop).
- (5) \*4: This indicates the distance between the QD75D□N and servo amplifier.
- (6) \*5: Use the same logic (positive logic/negative logic) for the QD75D□N and servo amplifier. The QD75D□N is initially set to negative logic.

## Appendix 5 Connection examples with stepping motors manufactured by ORIENTAL MOTOR Co., Ltd.

### Appendix 5.1 Connection example of QD75P□N and VEXTA UPD (Open collector) \*4

#### REMARK

- (1) \*1: The logic for each I/O terminal can be changed with " **Pr.22** Input signal logic selection" and " **Pr.23** Output signal logic selection" in detailed parameters 1. (Negative logic is used for all terminals in the example above.)
- (2) \*2: The QD75P□N upper limit (FLS) and lower limit (RLS) are used in the OPR retry function.
- (3) \*3: Refer to the manual of the stepping motor drive for information on the stepping motor drive side wiring and various signal wire shields not shown above.
- (4) \*4: Use the same logic (positive logic/negative logic) for the QD75P□N and stepping motor. The QD75P□N is initially set to negative logic.
- (5) \*5: This indicates the distance between the QD75P□N and VEXTA UPD.

## Appendix 6 Connection examples with servo amplifiers manufactured by Panasonic Corporation

### Appendix 6.1 Connection example of QD75D□N and MINAS-A series (Differential driver) \*4

#### REMARK

- (1) \*1: The logic for each I/O terminal can be changed with " **Pr.22** Input signal logic selection" and " **Pr.23** Output signal logic selection" in detailed parameters 1. (Negative logic is used for all terminals in the example above.)
- (2) \*2: The QD75D□N upper limit (FLS) and lower limit (RLS) are used in the OPR retry function. Set these signals inside the servo amplifier limit switches.
- (3) \*3: Refer to the manual of the servo amplifier for information on the servo amplifier side wiring and various signal wire shields not shown above.
- (4) \*4: Use the same logic (positive logic/negative logic) for the QD75D□N and servo amplifier. The QD75D□N is initially set to negative logic.
- (5) \*5: This indicates the distance between the QD75D□N and MINAS-A.

## Appendix 7 Connection examples with servo amplifiers manufactured by SANYO DENKI Co., Ltd.

### Appendix 7.1 Connection example of QD75D□N and PYO series (Differential driver) \*4

#### REMARK

- (1) \*1: The logic for each I/O terminal can be changed with " Pr.22 Input signal logic selection" and " Pr.23 Output signal logic selection" in detailed parameters 1. (Negative logic is used for all terminals in the example above.)
- (2) \*2: The QD75D□N upper limit (FLS) and lower limit (RLS) are used in the OPR retry function. Set these signals inside the servo amplifier limit switches.
- (3) \*3: Refer to the manual of the servo amplifier for information on the servo amplifier side wiring and various signal wire shields not shown above.
- (4) \*4: Use the same logic (positive logic/negative logic) for the QD75D□N and servo amplifier. The QD75D□N is initially set to negative logic.
- (5) \*5: This indicates the distance between the QD75D□N and PYO.

## Appendix 8 Connection examples with servo amplifiers manufactured by YASKAWA Electric Corporation

### Appendix 8.1 Connection example of QD75D□N and $\Sigma$ -II series (Differential driver)\*<sup>4</sup>

#### REMARK

- (1) \*1: The logic of each I/O terminal can be changed with " **Pr.22** Input signal logic selection" and " **Pr.23** Output signal logic selection" in detailed parameters 1. (Negative logic is used for all terminals in the example above.)
- (2) \*2: The QD75D□N upper limit (FLS) and lower limit (RLS) are used in the OPR retry function. Set these signals inside the servo amplifier limit switches.
- (3) \*3: Refer to the manual of the servo amplifier for information on the servo amplifier side wiring and various signal wire shields not shown above.
- (4) \*4: Use the same logic (positive logic/negative logic) for the QD75D□N and servo amplifier. The QD75D□N is initially set to negative logic.
- (5) \*5: This indicates the distance between the QD75D□N and  $\Sigma$ -II.

## Appendix 9 Comparisons with conventional positioning modules

## Appendix 9.1 Comparisons with A1SD71S2 model

The following shows comparisons with the conventional positioning module A1SD71S2, centered on the QD75 specifications.

| Model                                        |                                       | QD75P1N/QD75P1<br>QD75D1N/QD75D1                                           | QD75P2N/QD75P2<br>QD75D2N/QD75D2 | QD75P4N/QD75P4<br>QD75D4N/QD75D4 | A1SD71S2                            |

○ : Possible, × : Not possible

- \* 1: Up to 100 data items/axis of positioning data (No. 1 to 100) can be set using the buffer memory. The positioning data in the buffer memory is not backed up.
- \* 2: Indicates the standard mode/stepping motor mode about A1SD75P□-S3.
- \* 3: Indicates the INC mode/ABS mode in speed-position switching control.
- \* 4: The deviation counter clear signal output time can be set with parameters.
- \* 5: The movement amount against the number of pulses input from manual pulsar is as follows:
- QD75: Movement amount = "Number of pulses" × "Unit setting" × "Manual pulse generator 1 pulse input magnification" (refer to Section 11.4.1.)
  - A1SD75: Movement amount = "Number of pulses" × "Manual pulse generator 1 pulse input magnification"
- \* 6: The near pass function is valid only during the continuous path control. (A1SD75: Selected with parameters, QD75: Standard function)

| Multiple PLC compatible function                                 |                                                                                                                                                                                                                                                                                                           | Refer to QCPU User's Manual (Multiple CPU System).                        |
| Deceleration start flag function                                 |                                                                                                                                                                                                                                                                                                           | Refer to Section 12.7.8                                                   |
| Stop command processing for deceleration stop function           |                                                                                                                                                                                                                                                                                                           | Refer to Section 12.7.9                                                   |

## Functions deleted from those of A1SD75P1-S3/A1SD75P2-S3/A1SD75P3-S3

| Deleted functions                                 | Remarks                                                                                                                                                                                                                     |
|---------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Stepping motor mode                               | —                                                                                                                                                                                                                           |
| OPR operation error (Error code: 208)             | —                                                                                                                                                                                                                           |
| Fast machine OPR                                  | —                                                                                                                                                                                                                           |
| Special start (stop)                              | —                                                                                                                                                                                                                           |
| Indirect designation                              | In the QD75, the start block area on the buffer memory is expanded to five blocks (0 to 4). Each start block can be directly designated with positioning start No. (7000 to 7004).                                          |
| Block transfer                                    | With the A1SD75, this interface is used to set positioning data Nos. 101 to 600 that do not exist on the buffer memory. Since all positioning data can be set in the buffer memory with the QD75, this function is deleted. |
| Positioning data I/F                              |                                                                                                                                                                                                                             |
| Start history storage during error                | The contents are the same as those of the start history. Therefore, the QD75 stores only the start history.                                                                                                                 |
| System monitor data (module type, OS information) | These data were deleted because they can be displayed in system monitor "Module's detailed information" of GX Developer. (Refer to GX Developer Operating Manual.)                                                          |

## Functions changed from those of A1SD75P1-S3/A1SD75P2-S3/A1SD75P3-S3

| Changed functions                         | Descriptions                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
|-------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Software stroke limit function            | <ol style="list-style-type: none"> <li>1. The limit check of arc address is carried out only when a sub point is designated. It is not carried out when a center point is designated.</li> <li>2. The software stroke limit check during speed control is carried out in the following cases: <ul style="list-style-type: none"> <li>• When the software stroke limit is applied to the current feed value with [Pr.14] and the current feed value is updated with [Pr.21].</li> <li>• When the software stroke limit is applied to the machine feed value.</li> </ul> </li> <li>3. If an attempt is made to change the current value but the designated address is out of the software stroke limit range, the attempt is considered as an error and the current value is not changed.</li> <li>4. The conventional models feature three types of software stroke limit error codes for upper limit and lower limit respectively. With the QD75, errors for the software stroke upper limit are integrated into error code 507, and errors for the lower limit are integrated into error code 508. Error codes 509 to 512 are deleted.</li> </ol> |
| Current value changing<br>M code function | <ol style="list-style-type: none"> <li>1. An error occurs when the designated new current value is out of the software stroke limit range.</li> <li>2. The M code setting value is valid during the positioning data current value changing instruction.</li> </ol>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| Acceleration/deceleration control         | <ol style="list-style-type: none"> <li>1. An error occurs when the command frequency value calculated from the speed limit value is out of the maximum command frequency of the positioning module being used.</li> <li>2. Only two-word type (1 to 8388608ms) can be used as the setting value for the acceleration/deceleration time. (The switch between 1-word type and 2-word type is eliminated.)</li> </ol>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |

| Use prohibited |                            | Y00 to Y0F<br>Y1E to Y1F | Y01 to Y03<br>Y18 to Y1F |

\* 1: The ON/OFF statuses for READY are different between the QD75 and A1SD75.

|        | Not READY/WDT error | READY |
|--------|---------------------|-------|
| QD75   | OFF                 | ON    |
| A1SD75 | ON                  | OFF   |

\* 2: When using a program example of No.10 Reset program described in Section 6.4 Positioning program examples of the "A1SD75P1-S3/P2-S3/P3-S3, AD75P1-S3/P2-S3/P3-S3 Positioning Module User's Manual" for the QD75, replace "X4 (BUSY signal for Axis 1)" with "DXC (Direct access input of BUSY signal for Axis 1)". Do the same thing for programs for Axis 2 and Axis 3.

## (4) Buffer memory address comparisons

The following table shows the buffer memory addresses of the QD75 (Axis 1 to Axis 3) corresponding to the items of the A1SD75.

The shaded area shows the differences between the A1SD75 and QD75.

| Items of A1SD75                                          | Buffer memory address |        |        |        |        |        |
|----------------------------------------------------------|-----------------------|--------|--------|--------|--------|--------|
|                                                          | A1SD75                |        |        | QD75   |        |        |
|                                                          | Axis 1                | Axis 2 | Axis 3 | Axis 1 | Axis 2 | Axis 3 |
| Pr.1 Unit setting                                        | 0                     | 150    | 300    | 0      | 150    | 300    |

\* 2: With the QD75, it is called "block start data".

\* 3: With the QD75, the "block start data" and "condition data" in the shaded area are called "start block 0". There are five start blocks: 0 to 4.

Refer to Appendix 13 "List of buffer memory addresses" for details.

## (5) Data indication No. comparisons

The following table shows the comparisons of numbers for each symbols (Pr., Md., Cd., and Da.) indicating parameters or positioning data items.

The shaded sections indicate the added or changed items with the QD75.

## Parameters

| Item                                               | A1SD75 | QD75  |
|----------------------------------------------------|--------|-------|
| Unit setting                                       |        | Pr.1  |

## Appendix 10 When using GX Works2

The following shows the procedure for positioning operation when GX Works2 is used.

For details on the operation method of GX Works2, refer to the following.

GX Works2 Version 1 Operating Manual (Common)

For details on operation in GX Works2 for the QD75, refer to the following.

GX Works2 Version 1 Operating Manual (Intelligent Function Module)

## Appendix 10.1 Adding a module

Add the model name of the positioning module to be used in the project.

## (1) Operating procedure

1. Open the "New Module..." dialog box.

Project window → Right-click [Intelligent Function Module] → "New Module..."

2. Configure settings

Set the following items.

| Item             |                           | Contents                                                                                                                                     |
|------------------|---------------------------|----------------------------------------------------------------------------------------------------------------------------------------------|
| Module Selection | Module Type               | Select "QD75 Type Positioning Module".                                                                                                       |
|                  | Module Name               | Select the model name of the module to be connected.                                                                                         |
| Mount Position   | Mounted Slot No.          | Select the number of the slot where the module is mounted.                                                                                   |
|                  | Specify start X/Y address | The start I/O number (hexadecimal) of the module to be mounted on the slot set in "Mounted Slot No." is displayed. The value can be changed. |
| Title Setting    | Title                     | Enter a title.                                                                                                                               |

## Appendix 10.2 Setting parameters

Set parameters for the positioning module.

By setting parameters, the parameter setting by sequence program is not needed.

### ■ Parameter setting

#### (1) Operating procedure

1. Open the "Parameter" window.

Project window → [Intelligent Function Module] → Module name → "Parameter"

2. Configure settings

Double-click the setting-target item and select or enter a value.

- Items with a pull-down list  
Double-click the item and select an item in the displayed pull-down list.
- Items without a pull-down list  
Double-click the item and enter a value.

For details on the setting items, refer to the following.

| Parameter               | Reference     |
|-------------------------|---------------|
| Basic parameters 1      | Section 5.2.1 |
| Basic parameters 2      | Section 5.2.2 |
| Detailed parameters 1   | Section 5.2.3 |
| Detailed parameters 2   | Section 5.2.4 |
| OPR basic parameters    | Section 5.2.5 |
| OPR detailed parameters | Section 5.2.6 |

## ■ Setting positioning data

### (1) Operating procedure

1. Open the "Parameter" window.

Project window → [Intelligent Function Module] → Module name →  
"Positioning\_Axis\_#□\_Data"

2. Configure settings.

Double-click the setting-target item and select or enter a value.

- Items with a pull-down list  
Double-click the item and select an item in the displayed pull-down list.
- Items without a pull-down list  
Double-click the item and enter a value.

### POINT

In the default status, the data displayed on "Positioning\_Axis\_#□\_Data" are only No. 1 to No. 100 of positioning data. To display the data No. 101 and later, change the display range under "Display Specification of Positioning data".

[Tool] → [Options...] → [Intelligent Function Module] → "QD75/LD75 Type Positioning"

(Example) To display No.1 to No. 120 of positioning data

(2) Sub-function

- Offline Simulation

The locus and waveform of configured positioning data can be checked.

- Automatic Command Speed Calculation

Constant speed is automatically calculated by setting the time for positioning from the starting position to the target position.

- Automatic Sub Arc Calculation

The circular interpolation control data for two positioning data interpolation is automatically created, by selecting two positioning data and setting the radius.

**Automatic Sub Arc Calculation**

**Entry**

[Operation Procedure]  
 (1) Select a positioning data No. to calculate the sub arc.  
 (2) Set the P0 (start point) and radius.  
 (3) Press the "Calculate Sub Arc" button.

Execute circular interpolation for positioning data No.  and positioning data No.   
 Edit and calculation are not enabled because circular interpolation cannot be executed with the control system of this data.

P0 (start point) Address  
☒ Use simulation result  
☐ Directly specify start point address

Reference Axis  pulse Interpolation Axis  pulse Radius  pulse

**Illustration**

| No. | Axis | Operation Pattern | Control System | Axis to be Interpolated | Positioning Address |
|-----|------|-------------------|----------------|-------------------------|---------------------|
| P1  | 2    | Axis #1           | 0:END          | 02h:INC line 1          | -                   |
| P2  | 3    | Axis #1           |                |                         | 5000 pulse          |

**Explanation**  
 Set the start positioning data No. for circular interpolation.  
 Sub arc can be calculated only when both of the control systems of specified positioning data and the next positioning data are any of "0Ah:ABS line 2", "0Bh:INC line 2" or "0Ch:Feed 2".  
 Range: 1 to 598

**Calculation Result**

| No. | Axis | Operation Pattern | Control System | Axis to be Interpolated | Positioning Address | Arc Address |
|-----|------|-------------------|----------------|-------------------------|---------------------|-------------|
|     |      |                   |                |                         |                     |             |
|     |      |                   |                |                         |                     |             |
|     |      |                   |                |                         |                     |             |
|     |      |                   |                |                         |                     |             |
|     |      |                   |                |                         |                     |             |
|     |      |                   |                |                         |                     |             |
|     |      |                   |                |                         |                     |             |
|     |      |                   |                |                         |                     |             |
|     |      |                   |                |                         |                     |             |
|     |      |                   |                |                         |                     |             |

- M Code Comment Edit

Set and display M code comments of the positioning module.

**M Code Comment Edit 0000:QD75P4N**

| No. | M Code | M Code Comment |
|-----|--------|----------------|
| 1   |        |                |
| 2   |        |                |
| 3   |        |                |
| 4   |        |                |
| 5   |        |                |
| 6   |        |                |
| 7   |        |                |
| 8   |        |                |
| 9   |        |                |
| 10  |        |                |

For details on each function, refer to the GX Works2 Version1 Operating Manual (Intelligent Function Module).

## ■ Setting block start data

### (1) Operating procedure

1. Open the "Parameter" window.

Project window → [Intelligent Function Module] → Module name →  
"Starting\_Axis\_#□\_Block\_Data"

| Point No. | Shape      | Positioning start data No. | Special start instruction | Parameter | Condition data     |
|-----------|------------|----------------------------|---------------------------|-----------|--------------------|
| 1         | 0:Exit     | 200                        | 00h:Normal Start          | 0         |                    |
| 2         | 0:Exit     | 201                        | 01h:Condition Start       | 1         | 0(Buffer Memory) = |
| 3         | 0:Exit     | 202                        | 02h:Wait Start            | 6         |                    |
| 4         | 1:Continue | 203                        | 03h:Simultaneous Start    | 1         | 0(Buffer Memory) = |
| 5         | 1:Continue | 204                        | 04h:FOR Loop              | 0         | Repetition Count   |
| 6         |            |                            |                           |           |                    |
| 7         |            |                            |                           |           |                    |
| 8         |            |                            |                           |           |                    |

2. Configure settings.

Double-click the setting-target item and select or enter a value.

- Items with a pull-down list  
Double-click the item and select an item in the displayed pull-down list.
- Items without a pull-down list  
Double-click the item and enter a value.

For details on the setting items, refer to Section 5.4 "List of block start data".

## Appendix 10.3 Setting auto refresh

Transfer data in the buffer memory of the positioning module to specified devices in the CPU module.

By setting auto refresh, reading by sequence program is not needed.

## (1) Operating procedure

1. Open the "Auto\_Refresh" window.

Project window → [Intelligent Function Module] → Module name → "Auto\_Refresh"

2. Enter devices.

Click the text box of the item to be set, and enter the auto refresh target device.

**POINT**

To validate the auto refresh data after writing them into the CPU module, power off and then on or reset the CPU module.

## Appendix 10.4 Positioning monitor

With the positioning monitor function, the QD75 operating status can be confirmed, and debugging can be performed.

The following five types of monitors are available in this function:

- Axis Monitor : The actual status of each axis can be monitored.
- Starting History : 16 starting history logs of operations such as positioning operation, JOG operation, and manual pulse generator operation can be monitored.
- Error History : 16 error history logs can be monitored.
- Warning History : 16 warning history logs can be monitored.
- Module Information List : Signals and flag ON/OFF status of each axis can be monitored.

### ■ Axis Monitor

#### (1) Operating procedure

1. Starting the "Positioning Monitor" window

Display the "Positioning Monitor" window.

[Tool] → [Intelligent Function Module Tool] → [QD75/LD75 Positioning Module] → [Positioning Monitor...]

By default, the "Axis Monitor" window is displayed. When displaying the "Axis Monitor" window from the status which another window is selected, proceed according to the 2. below.

## 2. Switching to the "Axis Monitor" window

Click the "Axis Monitor" button (  ) on the toolbar.

The display switches to the "Axis Monitor" window.

## 3. Selecting the monitor type

Select the monitor type from the pull-down menu of "Monitor type".

- "Operation monitor"
- "Operation monitor (Axis control)"
- "Operation monitor (Speed-position switching control)"
- "Operation monitor (Position-speed switching control)"
- "Operation monitor (OPR monitor)"
- "Operation monitor (JOG/manual pulse)"

## 4. Selecting the monitor axis and monitor item

1) Click the **Monitor Item Selection** button.

The "Monitor Item Selection" window is displayed.

2) Select the ☐ of the axes and items to be monitored.

The following shows the selectable monitor items for each monitor type.

• For "Operation monitor":

| Monitor item                                            | Symbol of reference buffer memory | Reference     |
|---------------------------------------------------------|-----------------------------------|---------------|
| Current feed value                                      | Md.20                             | Section 5.6.2 |
| Axis feed speed                                         | Md.28                             |               |
| Axis operation status                                   | Md.26                             |               |
| Positioning data No. being executed                     | Md.44                             |               |
| Positioning data being executed running pattern         | Md.47                             |               |
| Positioning data being executed control method          |                                   |               |
| Positioning data being executed axis to be interpolated |                                   |               |
| Positioning data being executed acceleration time No.   |                                   |               |
| Positioning data being executed deceleration time No.   |                                   |               |
| Axis error No. ...                                      | Md.23                             |               |
| Axis warning No. ...                                    | Md.24                             |               |
| Valid M code                                            | Md.25                             |               |

• For "Operation monitor (Axis control)":

| Monitor item                         | Symbol of reference buffer memory | Reference     |
|--------------------------------------|-----------------------------------|---------------|
| Current feed value                   | Md.20                             | Section 5.6.2 |
| Axis feed speed                      | Md.28                             |               |
| Axis operation status                | Md.26                             |               |
| Target value                         | Md.32                             |               |
| Machine feed value                   | Md.21                             |               |
| New current value                    | Cd.9                              | Section 5.7.2 |
| New speed value                      | Cd.14                             |               |
| Positioning operation speed override | Cd.13                             |               |
| Step mode                            | Cd.34                             |               |
| Step valid flag                      | Cd.35                             |               |
| Speed change being processed flag    | Md.40                             | Section 5.6.2 |
| Status speed change 0 flag           | Md.31                             |               |
| External command valid               | Cd.8                              | Section 5.7.2 |
| Skip command                         | Cd.37                             |               |

• For "Operation monitor (Speed-position switching control)":

| Monitor item                                                     | Symbol of reference buffer memory | Reference     |
|------------------------------------------------------------------|-----------------------------------|---------------|
| Current feed value                                               | Md.20                             | Section 5.6.2 |
| Axis feed speed                                                  | Md.28                             |               |
| Axis operation status                                            | Md.26                             |               |
| Target speed                                                     | Md.33                             |               |
| Feedrate                                                         | Md.22                             |               |
| Current speed                                                    | Md.27                             |               |
| Positioning amount of speed and position switch control          | Md.29                             | Section 5.7.2 |
| Speed-position switching control movement amount change register | Cd.23                             |               |
| Status speed and position change latch flag                      | Md.31                             | Section 5.6.2 |
| Speed-position switching enable flag                             | Cd.24                             | Section 5.7.2 |
| Status speed controlling flag                                    | Md.31                             | Section 5.6.2 |

• For "Operation monitor (Position-speed switching control)":

| Monitor item                                           | Symbol of reference buffer memory | Reference     |
|--------------------------------------------------------|-----------------------------------|---------------|
| Current feed value                                     | Md.20                             | Section 5.6.2 |
| Axis feed speed                                        | Md.28                             |               |
| Axis operation status                                  | Md.26                             |               |
| Target speed                                           | Md.33                             |               |
| Feedrate                                               | Md.22                             |               |
| Current speed                                          | Md.27                             |               |
| Position-speed switching control speed change register | Cd.25                             | Section 5.7.2 |
| Status position and speed change latch flag            | Md.31                             | Section 5.6.2 |
| Position-speed switching enable flag                   | Cd.26                             | Section 5.7.2 |
| Status speed controlling flag                          | Md.31                             | Section 5.6.2 |

• For "Operation monitor (OPR monitor)":

| Monitor item                                | Symbol of reference buffer memory | Reference     |
|---------------------------------------------|-----------------------------------|---------------|
| Current feed value                          | Md.20                             | Section 5.6.2 |
| Axis feed speed                             | Md.28                             |               |
| Axis operation status                       | Md.26                             |               |
| Movement amount after near-point dog ON     | Md.34                             |               |
| Torque limitation stored value              | Md.35                             |               |
| Status command in-position flag             | Md.31                             |               |
| Status OPR request flag                     |                                   |               |
| Status OPR complete flag                    |                                   |               |
| External I/O signal lower limit             | Md.30                             |               |
| External I/O signal upper limit             |                                   |               |
| External I/O signal zero signal             |                                   |               |
| External I/O signal near-point dog signal   |                                   |               |
| External I/O signal deviation counter clear |                                   |               |

• For "Operation monitor (JOG/manual pulse)":

| Monitor item                                          | Symbol of reference buffer memory<br>or device No. of the output signal |        |        |        | Reference     |
|-------------------------------------------------------|-------------------------------------------------------------------------|--------|--------|--------|---------------|
|                                                       | Axis 1                                                                  | Axis 2 | Axis 3 | Axis 4 |               |
| Current feed value                                    | Md.20                                                                   |        |        |        | Section 5.6.2 |
| Axis feed speed                                       | Md.28                                                                   |        |        |        |               |
| Axis operation status                                 | Md.26                                                                   |        |        |        |               |
| Forward JOG start                                     | Y8                                                                      | YA     | YC     | YE     | Section 3.3.3 |
| Reverse JOG start                                     | Y9                                                                      | YB     | YD     | YF     |               |
| JOG speed                                             | Cd.17                                                                   |        |        |        | Section 5.7.2 |
| JOG speed limit value                                 | Pr.31                                                                   |        |        |        | Section 5.2.4 |
| JOG acceleration time                                 | Pr.32                                                                   |        |        |        |               |
| JOG deceleration time                                 | Pr.33                                                                   |        |        |        |               |
| Manual pulse generator enable flag                    | Cd.21                                                                   |        |        |        | Section 5.7.2 |
| Manual pulse generator input selection                | Pr.24                                                                   |        |        |        | Section 5.2.3 |
| Manual pulse generator 1 pulse input<br>magnification | Cd.20                                                                   |        |        |        | Section 5.7.2 |

3) Click the  button to close the "Monitor Item Selection" window.

The selected items are reflected to the "Axis Monitor" window.

## ■ Starting History

### (1) Operating procedure

#### 1. Starting the "Positioning Monitor" window

Display the "Positioning Monitor" window.

[Tool] → [Intelligent Function Module Tool] → [QD75/LD75 Positioning Module] → [Positioning Monitor...]

#### 2. Switching to the "Starting History" window

Click the "Starting History" button (  ) on the toolbar.

The display switches to the "Starting History" window.

When the number of logs exceeds 16, the latest log overwrites the oldest log so that the latest 16 starting histories can be monitored all the time.

Also, the error details can be confirmed by clicking the error number.

For details on the starting history, refer to Section 5.6.1.

## ■ Error History

### (1) Operating procedure

#### 1. Starting the "Positioning Monitor" window

Display the "Positioning Monitor" window.

[Tool] → [Intelligent Function Module Tool] → [QD75/LD75 Positioning Module] → [Positioning Monitor...]

#### 2. Switching to the "Error History" window

Click the "Error History" button (  ) on the toolbar.

The display switches to the "Error History" window.

When the number of logs exceeds 16, the latest log overwrites the oldest log so that the latest 16 error histories can be monitored all the time.

Also, the error details can be confirmed by clicking the axis error No.

## ■ Warning History

### (1) Operating procedure

#### 1. Starting the "Positioning Monitor" window

Display the "Positioning Monitor" window.

[Tool] → [Intelligent Function Module Tool] → [QD75/LD75 Positioning Module] → [Positioning Monitor...]

#### 2. Switching to the "Warning History" window

Click the "Warning History" button (  ) on the toolbar.

The display switches to the "Warning History" window.

When the number of logs exceeds 16, the latest log overwrites the oldest log so that the latest 16 warning histories can be monitored all the time.

Also, the warning details can be confirmed by clicking the axis warning No.

## ■ Module Information List

### (1) Operating procedure

#### 1. Starting the "Positioning Monitor" window

Display the "Positioning Monitor" window.

[Tool] → [Intelligent Function Module Tool] → [QD75/LD75 Positioning Module] → [Positioning Monitor...]

"Module Information List" window

The status by each axis of the following items is displayed in the "Module Information List" window.

| Monitor item                                | Device No. of the I/O signal device<br>or symbol of the buffer memory to<br>be referred |        |        |        | Reference     |
|---------------------------------------------|-----------------------------------------------------------------------------------------|--------|--------|--------|---------------|
|                                             | Axis 1                                                                                  | Axis 2 | Axis 3 | Axis 4 |               |

| Status speed change 0 flag                  |                                                                                         |        |        |        |               |

Statuses turned ON are displayed in green by each axis.

Also, at error occurrence, the axis in which the error occurred ("Error detection") is displayed in red.

At occurrence of warning, the axis in which the warning occurred ("Status axis warning detection") is displayed in orange.

## Appendix 10.5 Positioning test

This function allows users to perform the following tests while monitoring the current status of the QD75.

- Positioning start test
- JOG/manual pulse generator/OPR test
- Speed change test
- Current value change test

### ■ Positioning start test

Test operation is performed by specifying the positioning data No. or point No. of the block start data.

#### (1) Operating procedure

1. Open the "Positioning Test" dialog box.

[Tool] → [Intelligent Function Module Tool] → [QD75/LD75 Positioning Module] → [Positioning Test...]

Monitor current values such as the current feed value and feedrate.

Test each function while checking current values with the monitor.

**Positioning Test**

Target Module: QD75P4N I/O Address: 0000

| Monitor Item          | Axis #1   | Axis #2   | Axis #3   | Axis #4   |
|-----------------------|-----------|-----------|-----------|-----------|
| Current feed value    | 0 pulse   | 0 pulse   | 0 pulse   | 0 pulse   |
| Machine feed value    | 0 pulse   | 0 pulse   | 0 pulse   | 0 pulse   |
| Feedrate              | 0 pulse/s | 0 pulse/s | 0 pulse/s | 0 pulse/s |
| Axis error number     | 0         | 0         | 0         | 0         |
| Axis warning No.      | 0         | 0         | 0         | 0         |
| Valid M code          | 0         | 0         | 0         | 0         |
| Axis operation status | Standby   | Standby   | Standby   | Standby   |
| Current speed         | 0 pulse/s | 0 pulse/s | 0 pulse/s | 0 pulse/s |
| Axis feedrate         | 0 pulse/s | 0 pulse/s | 0 pulse/s | 0 pulse/s |

**Test**

Target Axis: Axis #1

Select Function: Positioning start signal Please set this function after stopping the positioning.

Start Type:
 

- ☒ Positioning Start Signal
- ☐ Block Start
- ☐ Multiple Axes Simultaneous Start

Positioning start data

Positioning Data No. (1 to 600): 1

Step:
 

- ☐ Start step
- Step Mode: Execute step operation by declaration

External Command:
 

- ☐ External Command Valid
- ☐ Speed-position Switching Enable Flag
- ☐ Position-speed Switching Enable Flag

Buttons: Starting, Skip, Stop Target Axis(J), Stop All Axis, Restart Stop Axis, Positioning Complete, Error/Warning Details Confirmation, Error/Warning Reset, M Code OFF Request, Close

## 2. Select the test target axis.

Select the test target axis from the pull-down menu of "Target Axis".

## 3. Select the function.

Select "Positioning start signal" from the pull-down menu of "Select Function".

The screenshot shows the 'Test' dialog box with the following settings:

- Target Axis:** Axis #1
- Select Function:** Positioning start signal
- Start Type:** Positioning Start Signal (selected), Block Start, Multiple Axes Simultaneous Start
- Positioning start data:** Positioning Data No. (1 to 600) set to 1
- Step:** Start step checkbox is checked, Step Mode is 'Execute step operation by declaration', Continue button is visible.
- External Command:** External Command Valid checkbox is checked, Speed-position Switching Enable Flag and Position-speed Switching Enable Flag are unchecked, Set button is visible.
- Buttons:** Starting, Stop, Stop Target Axis(J), Stop All Axis, Restart Stop Axis, Positioning Complete, Error/Warning Details Confirmation, Error/Warning Reset, M Code OFF Request, Close.

## 4. Perform positioning start test.

1) Select "Positioning Start Signal", "Block Start", or "Multiple Axes Simultaneous Start" for "Start Type".

2) Set positioning start data according to the setting for "Start Type".

- Positioning Start Signal: Set the positioning data No.
- Block Start: Set the block No. and point No.
- Multiple Axes Simultaneous Start: Set the multiple axes simultaneous start data No.

Set "Step" and "External Command" as needed.

## • Step

To perform test operation by step start, check the "Start step" checkbox, select a step mode from the pull-down list, and click the **Continue** button.

## • External Command

To enable external commands or control switch, select the corresponding item and click the **Set** button.

3) Click the **Starting** button to perform test operation.

## ■ JOG/manual pulse generator/OPR test

The following test can be performed when positioning control is debugged by the JOG operation test or manual pulse operation test.

- Direction check (forward run or reverse run)
- On/off status check of external input signals, such as upper/lower limit switches, zero signal, or near-point dog signal
- Operation test of speed and acceleration/deceleration
- Measurement of backlash compensation amount for forward/reverse rotation
- Accurate address check and movement amount measurement

In addition, the OP is established and the OPR basic and detailed parameters are corrected by the OPR test.

### (1) Operating procedure

1. Open the "Positioning Test" dialog box.

[Tool] → [Intelligent Function Module Tool] → [QD75/LD75 Positioning Module] → [Positioning Test]

Monitor current values such as the current feed value and feedrate.

Test each function while checking current values with the monitor.

**Positioning Test**

Target Module: QD75P4N I/O Address: 0000

| Monitor Item          | Axis #1   | Axis #2   | Axis #3   | Axis #4   |
|-----------------------|-----------|-----------|-----------|-----------|
| Current feed value    | 0 pulse   | 0 pulse   | 0 pulse   | 0 pulse   |
| Machine feed value    | 0 pulse   | 0 pulse   | 0 pulse   | 0 pulse   |
| Feedrate              | 0 pulse/s | 0 pulse/s | 0 pulse/s | 0 pulse/s |
| Axis error number     | 0         | 0         | 0         | 0         |
| Axis warning No.      | 0         | 0         | 0         | 0         |
| Valid M code          | 0         | 0         | 0         | 0         |
| Axis operation status | Standby   | Standby   | Standby   | Standby   |
| Current speed         | 0 pulse/s | 0 pulse/s | 0 pulse/s | 0 pulse/s |
| Axis feedrate         | 0 pulse/s | 0 pulse/s | 0 pulse/s | 0 pulse/s |

**Test**

Target Axis: Axis #1

Select Function: Positioning start signal Please set this function after stopping the positioning.

Start Type:
   
☒ Positioning Start Signal
   
☐ Block Start
   
☐ Multiple Axes Simultaneous Start

Positioning start data:
   
 Positioning Data No. (1 to 600): 1

Step:
   
☐ Start step
   
 Step Mode: Execute step operation by declaration

External Command:
   
☐ External Command Valid
   
☐ Speed-position Switching Enable Flag
   
☐ Position-speed Switching Enable Flag

Buttons: Starting, Skip, Stop Target Axis(1), Stop All Axis, Restart Stop Axis, Positioning Complete, Error/Warning Details Confirmation, Error/Warning Reset, M Code OFF Request, Close

2. Select the test target axis.

Select the test target axis from the pull-down menu of "Target Axis".

## 3. Select the function.

Select "JOG/Manual Pulse Generator/OPR" from the pull-down menu of "Select Function".

The screenshot shows the 'Test' window with the following settings:

- Target Axis: Axis #1
- Select Function: JOG/Manual Pulse Generator/OPR (Note: Please set this function after stopping the positioning.)
- JOG Speed: 1 pulse/s (1 to 1000000)
- Inching Movement Amount: 0 pulse (0 to 65535)
- Manual Pulse Generator:
  - Manual pulse generator enable flag: ☐
  - Manual Pulse 1 Pulse Generator Input Magnification: 1 x (1 to 100)
- OPR Operation:
  - OPR Method: Machine OPR
  - OPR button

Buttons at the bottom: Starting, Skip, Stop Target Axis(J), Stop All Axis, Restart Stop Axis, Positioning Complete, Error/Warning Details Confirmation, Error/Warning Reset, M Code OFF Request, Close.

## 1) Perform each operation.

- JOG operation

Set "JOG speed" to "1" or more, "Inching Movement Amount" to "0" and click the **Forward RUN** or **Reverse RUN** button.

- Manual Pulse Generator operation

Set "Manual pulse generator 1 pulse input magnification", select "Manual pulse generator enable flag" and use the manual pulse generator.

- OPR operation

Select the OPR method from "Machine OPR" and "Fast OPR", and click the **OPR** button.

## ■ Speed change test

The appropriate speed and acceleration/deceleration time can be checked by changing speed or acceleration/deceleration time or by performing override to the axis where the positioning start test, OPR test, or JOG operation test is performed.

### (1) Operating procedure

1. Open the "Positioning Test" dialog box.

Display the "Positioning Test" window.

[Tool] → [Intelligent Function Module Tool] → [QD75/LD75 Positioning Module] → [Positioning Test]

Monitor current values such as the current feed value and feedrate.

Test each function while checking current values with the monitor.

**Positioning Test**

Target Module: QD75P4N I/O Address: 0000

| Monitor Item          | Axis #1   | Axis #2   | Axis #3   | Axis #4   |
|-----------------------|-----------|-----------|-----------|-----------|
| Current feed value    | 0 pulse   | 0 pulse   | 0 pulse   | 0 pulse   |
| Machine feed value    | 0 pulse   | 0 pulse   | 0 pulse   | 0 pulse   |
| Feedrate              | 0 pulse/s | 0 pulse/s | 0 pulse/s | 0 pulse/s |
| Axis error number     | 0         | 0         | 0         | 0         |
| Axis warning No.      | 0         | 0         | 0         | 0         |
| Valid M code          | 0         | 0         | 0         | 0         |
| Axis operation status | Standby   | Standby   | Standby   | Standby   |
| Current speed         | 0 pulse/s | 0 pulse/s | 0 pulse/s | 0 pulse/s |
| Axis feedrate         | 0 pulse/s | 0 pulse/s | 0 pulse/s | 0 pulse/s |

**Test**

Target Axis: Axis #1

Select Function: Positioning start signal Please set this function after stopping the positioning.

Start Type: ☒ Positioning Start Signal ☐ Block Start ☐ Multiple Axes Simultaneous Start

Positioning start data: Positioning Data No. (1 to 600): 1

Step: ☐ Start step  Step Mode: Execute step operation by declaration

External Command: ☐ External Command Valid ☐ Speed-position Switching Enable Flag ☐ Position-speed Switching Enable Flag

2. Select the test target axis.

Select the test target axis from the pull-down menu of "Target Axis".

## 3. Select the function.

Select "New Speed" from the pull-down menu of "Select Function".

## 4. Execute the speed change test.

## 1) Execute the speed change function.

## • New Speed

Enter the new speed value during the startup of positioning start test or OPR test, and click the **New Speed** button.

## • Override

Enter the speed override value and click the **Speed Override Change** button.

## • Acceleration/Deceleration Time Change

Check the "Acceleration/deceleration time change enable" checkbox, set the acceleration time and deceleration time values, and click the **New Speed** button.

## ■ Current value change test

The current feed value of the QD75 can be changed to the specified address.

### (1) Operating procedure

1. Open the "Positioning Test" dialog box.

[Tool] → [Intelligent Function Module Tool] → [QD75/LD75 Positioning Module] → [Positioning Test]

Monitor current values such as the current feed value and feedrate.

Test each function while checking current values with the monitor.

**Positioning Test**

Target Module: QD75P4N I/O Address: 0000

| Monitor Item          | Axis #1   | Axis #2   | Axis #3   | Axis #4   |
|-----------------------|-----------|-----------|-----------|-----------|
| Current feed value    | 0 pulse   | 0 pulse   | 0 pulse   | 0 pulse   |
| Machine feed value    | 0 pulse   | 0 pulse   | 0 pulse   | 0 pulse   |
| Feedrate              | 0 pulse/s | 0 pulse/s | 0 pulse/s | 0 pulse/s |
| Axis error number     | 0         | 0         | 0         | 0         |
| Axis warning No.      | 0         | 0         | 0         | 0         |
| Valid M code          | 0         | 0         | 0         | 0         |
| Axis operation status | Standby   | Standby   | Standby   | Standby   |
| Current speed         | 0 pulse/s | 0 pulse/s | 0 pulse/s | 0 pulse/s |
| Axis feedrate         | 0 pulse/s | 0 pulse/s | 0 pulse/s | 0 pulse/s |

**Test**

Target Axis: Axis #1

Select Function: Positioning start signal Please set this function after stopping the positioning.

Start Type: ☒ Positioning Start Signal ☐ Block Start ☐ Multiple Axes Simultaneous Start

Positioning start data: Positioning Data No. (1 to 600): 1

Step: ☐ Start step  Step Mode: Execute step operation by declaration

External Command: ☐ External Command Valid ☐ Speed-position Switching Enable Flag ☐ Position-speed Switching Enable Flag

2. Select the test target axis.

Select the test target axis from the pull-down menu of "Target Axis".

## 3. Select the function.

Select "Current Value Changing" from the pull-down menu of "Select Function".

The screenshot shows the 'Test' dialog box with the following elements:

- Target Axis:** Axis #1
- Select Function:** Current Value Changing (Please set this function after stopping the positioning.)
- Current Value Changing sub-dialog:**
  - New Current Value:** 0
  - Range:** pulse (-2147483648 to 2147483647)
  - Button:** Current Value Changing
- Bottom Buttons:** Starting, Skip, Stop Target Axis(J), Stop All Axis, Restart Stop Axis, Positioning Complete, Error/Warning Details Confirmation, Error/Warning Reset, M Code OFF Request, Close.

1) Enter the new current value and click the Current Value Changing button.

## Appendix 10.6 Wave trace

This function displays the speed command (axis speed) in positioning operation in waveform data.

## (1) Operating procedure

1. Open the "Wave Trace" dialog box.

[Tool] → [Intelligent Function Module Tool] → [QD75/LD75 Positioning Module] → [Wave Trace]

## 2. Select the module.

Click the **Module Selection** button.

Select the positioning module to trace waves and click the **OK** button.

## 3. Set conditions.

Click the **Condition Setting** button.

Read the displayed description, set each condition, and click the **OK** button.

4. Start trace and display trace results.
- Click the **Start Trace** button to start trace.
- The trace result at that point can be displayed by clicking the **Display Current Trace Result** button during trace, even if the trace completion conditions are not met.
- When the completion conditions are met and the trace is completed, the trace result is displayed.

## Appendix 10.7 Location trace

This function displays 2-axis interpolation control and simultaneous start (2-axes) in locus data.

## (1) Operating procedure

1. Open the "Location Trace" dialog box.

[Tool] → [Intelligent Function Module Tool] → [QD75/LD75 Positioning Module] → [Location Trace]

## 2. Select the module.

Click the **Module Selection** button.

Select the positioning module to trace locations and click the **OK** button.

## 3. Set conditions.

Click the **Condition Setting** button.

Read the displayed description, set each condition, and click the **OK** button.

4. Start trace and display trace results.
- Click the **Start Trace** button to start trace.
- The trace result at that point can be displayed by clicking the **Display Current Trace Result** button during trace, even if the trace completion conditions are not met.
- When the completion conditions are met and the trace is completed, the trace result is displayed.

## Appendix 10.8 Parameter initialization function

The "parameter initialization function" is used to return the setting data set in the QD75 buffer memory and flash ROM to their factory-set initial values.

The details shown below explain about the "parameter initialization function".

- [1] Parameter initialization means
- [2] Control details
- [3] Control Precautions
- [4] Parameter initialization method

### [1] Parameter initialization means

- Initialization is executed with a program.
- Initialization is executed by GX Works2.

Refer to GX Works2 Version1 Operating Manual (Intelligent Function Module) for the execution method by GX Works2.

### [2] Control details

The following table shows the setting data initialized by the "parameter initialization function".

(The data initialized are "buffer memory" and " flash ROM " setting data.)

| Setting data                                                |
|-------------------------------------------------------------|
| Basic parameters ([Pr.1] to [Pr.10])                        |
| Detailed parameters ([Pr.11] to [Pr.42], [Pr.70], [Pr.150]) |
| OPR basic parameters ([Pr.43] to [Pr.48])                   |
| OPR detailed parameters ([Pr.49] to [Pr.57])                |
| Positioning data (No.1 to No.600)                           |
| Block start data (No.7000 to No.7004)                       |

### [3] Control Precautions

- (1) Parameter initialization is only executed when the positioning control is not carried out (when the PLC READY signal (Y0) is OFF).  
The warning "In PLC READY" (warning code: 111) will occur if executed when the PLC READY [Y0] is ON.
- (2) Writing to the flash ROM can be executed up to 100,000 times.  
If writing to the flash ROM exceeds 100,000 times, the writing may become impossible, and an error "Flash ROM write error" (error code: 801) will occur.
- (3) A "CPU module reset" or "CPU module power restart" must be carried out after the parameters are initialized.
- (4) If an error occurs on the parameter set in the QD75 when the PLC READY signal [Y0] is turned ON, the QD75 READY signal [X0] will not be turned ON and the control cannot be carried out.

#### Important

Parameter initialization takes about 10 seconds. (Up to 30 seconds are sometimes required.)  
Do not turn the power ON/OFF; reset the CPU module, etc., during parameter initialization. If the power is turned OFF or the CPU module is reset to forcibly end the process, the data backed up in the flash ROM will be lost.

#### [4] Parameter initialization method

- (1) Parameter initialization is carried out using the dedicated instruction "ZP.PINIT".  
(Refer to CHAPTER 14 "DEDICATED INSTRUCTIONS" for details.)

- (2) Parameter initialization can also be carried out by the writing of the data shown in the table below to the buffer memory using the TO instruction /intelligent function device.

The initialization of the parameter is executed at the time point the data is written to the QD75 buffer memory.

| Setting item                                                                                        | Setting value | Setting details                             | Buffer memory address |        |        |        |
|-----------------------------------------------------------------------------------------------------|---------------|---------------------------------------------|-----------------------|--------|--------|--------|
|                                                                                                     |               |                                             | Axis 1                | Axis 2 | Axis 3 | Axis 4 |
| <span style="border: 1px solid black; padding: 0 2px;">Cd.2</span> Parameter initialization request | 1             | Set "1" (parameter initialization request). | 1901                  |        |        |        |

Refer to Section 5.7 "List of control data" for details on the setting details.

When the initialization is complete, "0" will be set in " Cd.2 Parameter initialization request" by the QD75 automatically.

# Appendix 10.9 Execution data backup function

When the QD75 buffer memory data is rewritten from the CPU module, "the data backed up in the QD75 flash ROM" may differ from "the data (buffer memory data) for which control is being executed". In cases like these, the data being executed will be lost when the programmable controller power is turned OFF.  
(Refer to CHAPTER 7.)

In cases like these, the "execution data backup function" backs up the data being executed by writing it to the flash ROM. The data that was backed up is then written to the buffer memory when the power is turned ON next.

The details shown below explain about the "execution data backup function".

- [1] Execution data backup means
- [2] Control details
- [3] Control Precautions
- [4] Execution data backup method

## [1] Execution data backup (written to flash ROM) means

- The backup is executed with a program.
- The backup is executed by GX Works2.

Refer to GX Works2 Version1 Operating Manual (Common) for execution data backup method by GX Works2.

## [2] Control details

The following shows the data that can be written to the flash ROM using the "execution data backup function".

| Buffer memory                                |   | Flash ROM                                    |
|----------------------------------------------|---|----------------------------------------------|
| Parameters (Pr.1 to Pr.57,<br>Pr.70, Pr.150) | → | Parameters (Pr.1 to Pr.57,<br>Pr.70, Pr.150) |
| Positioning data (No. 1 to No. 600)          |   | Positioning data (No. 1 to No. 600)          |
| Block start data (No. 7000 to 7004)          |   | Block start data (No. 7000 to 7004)          |

## [3] Control Precautions

- (1) Parameter initialization is only executed when the positioning control is not carried out (when the PLC READY signal (Y0) is OFF). The warning "In PLC READY" (warning code: 111) will occur if executed when the PLC READY [Y0] is ON.
- (2) Writing to the flash ROM can be executed up to 100,000 times.  
If writing to the flash ROM exceeds 100,000 times, the writing may become impossible, and an error "Flash ROM write error" (error code: 801) will occur.
- (3) After one power ON/CPU module reset operation, writing to the flash ROM using a program is limited to up to 25 times.  
If the 26th writing is executed, an error "Flash ROM write number error" (error code: 801) will occur. If this error occurs, carry out the power OFF ON/CPU module reset operation again.  
Refer to Md.19 of Section 5.1.7 "Types and roles of monitor data" for details.

### Important

Do not turn the power ON/OFF, reset the CPU module, during writing to the flash ROM. If the power is turned OFF or the CPU module is reset to forcibly end the process, the data backed up in the flash ROM will be lost.

#### [4] Execution data backup method

- (1) Execution data backup (writing to the flash ROM) is carried out using the dedicated instruction "ZP.PFWRT". (Refer to CHAPTER 14 "DEDICATED INSTRUCTIONS" for details.)
- (2) Refer to Section 7.2 "Data transmission process" for the data transmission processing at the backup of the execution data.
- (3) Execution data backup can also be carried out by the writing of the data shown in the table below to the QD75 buffer memory using the TO instruction /intelligent function device.

The writing to the flash ROM is executed at the time point the data is written to the QD75 buffer memory.

| Setting item                                                                               | Setting value | Setting details                    | Buffer memory address |        |        |        |
|--------------------------------------------------------------------------------------------|---------------|------------------------------------|-----------------------|--------|--------|--------|
|                                                                                            |               |                                    | Axis 1                | Axis 2 | Axis 3 | Axis 4 |
| <span style="border: 1px solid black; padding: 0 2px;">Cd.1</span> Flash ROM write request | 1             | Set "1" (flash ROM write request). | 1900                  |        |        |        |

Refer to Section 5.7 "List of control data" for details on the setting details.

When the writing to the flash ROM is complete, "0" will be set in "Cd.1 Flash ROM write request" by the QD75 automatically.

## Appendix 10.10 External I/O signal logic switching function

This function switches the signal logic according to the external equipment connected to the QD75.

For the system in which drive unit READY with b-contact, upper limit switch, and lower limit switch are not used, the parameter logic setting can be controlled without wiring if it is changed to a "positive logic".

When the drive unit READY, upper limit switch, and lower limit switch are used, ensure to use them with b-contact.

The details shown below explain about the "external I/O signal logic switching function".

[1] Parameter setting details

[2] Precautions on parameter setting

### [1] Parameter setting details

To use the "external I/O signal logic switching function", set the parameters shown in the following table.

| Setting item |                               | Setting details                                                     |                                | Factory-set initial value | Buffer memory address |        |        |        |                                         |                                         |
|--------------|-------------------------------|---------------------------------------------------------------------|--------------------------------|---------------------------|-----------------------|--------|--------|--------|-----------------------------------------|-----------------------------------------|
|              |                               |                                                                     |                                |                           | Axis 1                | Axis 2 | Axis 3 | Axis 4 |                                         |                                         |
| Pr.22        | Input signal logic selection  | • Selection of logic of signals input from external source to QD75  |                                | 0                         | 31                    | 181    | 331    | 481    |                                         |                                         |
|              |                               | b0                                                                  | Lower limit                    |                           |                       |        |        |        | 0: Negative logic,<br>1: Positive logic |                                         |
|              |                               | b1                                                                  | Upper limit                    |                           |                       |        |        |        |                                         |                                         |
|              |                               | b2                                                                  | Drive unit READY               |                           |                       |        |        |        |                                         |                                         |
|              |                               | b3                                                                  | Stop signal                    |                           |                       |        |        |        |                                         |                                         |
|              |                               | b4                                                                  | External command signal        |                           |                       |        |        |        |                                         |                                         |
|              |                               | b5                                                                  | Zero signal                    |                           |                       |        |        |        |                                         |                                         |
|              |                               | b6                                                                  | Near-point dog signal          |                           |                       |        |        |        |                                         |                                         |
|              |                               | b7                                                                  | Unused                         |                           |                       |        |        |        |                                         | Set "0".                                |
|              |                               | b8                                                                  | Manual pulse generator input   |                           |                       |        |        |        |                                         | 0: Negative logic,<br>1: Positive logic |

\* Refer to Section 5.2 "List of parameters" for the information on detail settings.

### [2] Precautions on parameter setting

- (1) The external I/O signal logic switching parameters are validated when the PLC READY signal [Y0] is turned OFF to ON. (The logic is negative right after power-on.)
- (2) If each signal logic is set erroneously, the operation may not be carried out correctly.  
Before setting, check the specifications of the equipment to be used.

## Appendix 10.11 External I/O signal monitor function

The "external I/O signal monitor function" monitors the module's information and external I/O signal statuses in the module's detailed information which can be displayed on the system monitor of GX Works2.

The information that can be monitored are the module's information (same as the QD75 front "RUN", "ERR" LED indicators) and the following external I/O signals. Set the logic of the external I/O signals in " **Pr.22** Input signal logic selection" and " **Pr.23** Output signal logic selection".

Refer to the following manual for the system monitor of GX Works2.  
GX Works2 Version1 Operating Manual (Common)

## Appendix 10.12 History monitor function

This function monitors starting history, error history, and warning history stored in the buffer memory of the QD75 during operation.

## [1] Starting history

Sixteen starting history logs of operations such as positioning operation, JOG operation, and manual pulse generator operation can be monitored. When the number of logs exceeds 16, the latest log overwrites the oldest log so that the latest 16 logs can be monitored all the time. This function allows users to check the operation sequence (whether the operations have been started in a predetermined sequence) at system start-up.

To monitor the starting history, register the QD75 to the "Intelligent Function Module Monitor Window".

For details on the registration method and monitoring method, refer to the following.  
GX Works2 Version1 Operating Manual (Intelligent Function Module)

## [2] Error history, warning history

Sixteen error history logs and sixteen warning history logs can be monitored. When the number of logs exceeds 16, the latest log overwrites the oldest log so that the latest 16 logs can be monitored all the time.

| Error Occurrence Axis | Axis Error Number | Axis Error Occurrence Time |
|-----------------------|-------------------|----------------------------|
| Axis #1               | 106               | 03/12/05 07:19:37          |
| Axis #1               | 106               | 03/12/05 07:20:00          |
| Axis #1               | 106               | 03/12/05 07:20:05          |

|                         |                 |                              |
|                         |                 |                              |
|                         |                 |                              |
|                         |                 |                              |
|                         |                 |                              |
|                         |                 |                              |
|                         |                 |                              |
|                         |                 |                              |
|                         |                 |                              |

To monitor the error history and warning history, register the QD75 to the "Intelligent Function Module Monitor Window".

For details on the registration method and monitoring method, refer to the following.  
GX Works2 Version1 Operating Manual (Intelligent Function Module)

## Appendix 10.13 Checking errors

Error codes corresponding to the errors occurred in the QD75 can be checked on the following screen of GX Works2.

Select the screen according to the purpose and usage.

- "Module's Detailed Information" screen
- "Error History" screen (for the QD75P□N/QD75D□N only)

(1) Checking errors on the "Module's Detailed Information" screen

Select [Diagnostics] → [System Monitor...] on GX Works2.

Select QD75 for "Main Base" and click the **Detailed Information** button.

The "Module's Detailed Information" screen for the QD75 appears and the error code, error details, and corrective actions can be checked.

- (2) Checking errors on the "Error History" screen. (for the QD75P□N/QD75D□N only)

On the "Error History" screen, the error logs of the QD75 are displayed in a list together with the error logs of other modules. The logs can be output to a CSV format file. The error codes and the time of error occurrence can be checked even after the CPU module is powered off and then on or reset.

Select [Diagnostics] → [System Monitor...] → **System Error History** button on GX Works2.

- (a) Error History List  
Module error logs are displayed in a list.

## (b) Error and Solution, Intelligent Module Information

## • Error and Solution

Details of the selected in the "Error History List" and its corrective action are displayed.

## • Intelligent Module Information

The QD75P□N/QD75D□N status when the error selected in the "Error History List" occurred is displayed.

For the QD75P□N/QD75D□N, the following contents are displayed.

| Item                                                                                                                                                                                                                                                                                                       | Description                                                                                  |

| Start axis                                                                                                                                                                                                                                                                                                 | The axis No. requested to start is stored.                                                   |
| Positioning start No.                                                                                                                                                                                                                                                                                      | The positioning start No. is stored.                                                         |
| Axis in which the error occurred                                                                                                                                                                                                                                                                           | The axis No. in which the error occurred is stored.                                          |
| Axis error occurrence (Data No.)                                                                                                                                                                                                                                                                           | The data No. in which the error occurred is stored.                                          |
| Current feed value                                                                                                                                                                                                                                                                                         | The current feed value (at the time of error) of the error axis is stored.                   |
| Input signals with PLC CPU(X0 -- XF)                                                                                                                                                                                                                                                                       | The status of input signals (X0 to XF) (at the time of error) is stored (in hexadecimal).    |
| Input signals with PLC CPU(X10 -- X1F)                                                                                                                                                                                                                                                                     | The status of input signals (X10 to X1F) (at the time of error) is stored (in hexadecimal).  |
| Output signals with PLC CPU(Y0 -- YF)                                                                                                                                                                                                                                                                      | The status of output signals (Y0 to YF) (at the time of error) is stored (in hexadecimal).   |
| Output signals with PLC CPU(Y10 -- Y1F)                                                                                                                                                                                                                                                                    | The status of output signals (Y10 to Y1F) (at the time of error) is stored (in hexadecimal). |
| <ul style="list-style-type: none"> <li>• Axis 1 drive unit READY signal</li> <li>• Axis 1 upper limit signal</li> <li>• Axis 1 lower limit signal</li> <li>• Axis 1 stop signal</li> <li>• Axis 1 external command signal</li> <li>• Axis 1 near-point dog signal</li> <li>• Axis 1 zero signal</li> </ul> | The status of axis 1 external input signals (at the time of error) is stored.                |
| <ul style="list-style-type: none"> <li>• Axis 2 drive unit READY signal</li> <li>• Axis 2 upper limit signal</li> <li>• Axis 2 lower limit signal</li> <li>• Axis 2 stop signal</li> <li>• Axis 2 external command signal</li> <li>• Axis 2 near-point dog signal</li> <li>• Axis 2 zero signal</li> </ul> | The status of axis 2 external input signals (at the time of error) is stored.                |
| <ul style="list-style-type: none"> <li>• Axis 3 drive unit READY signal</li> <li>• Axis 3 upper limit signal</li> <li>• Axis 3 lower limit signal</li> <li>• Axis 3 stop signal</li> <li>• Axis 3 external command signal</li> <li>• Axis 3 near-point dog signal</li> <li>• Axis 3 zero signal</li> </ul> | The status of axis 3 external input signals (at the time of error) is stored.                |
| <ul style="list-style-type: none"> <li>• Axis 4 drive unit READY signal</li> <li>• Axis 4 upper limit signal</li> <li>• Axis 4 lower limit signal</li> <li>• Axis 4 stop signal</li> <li>• Axis 4 external command signal</li> <li>• Axis 4 near-point dog signal</li> <li>• Axis 4 zero signal</li> </ul> | The status of axis 4 external input signals (at the time of error) is stored.                |

- (c) Create CSV File button

The module error logs are output to a CSV format file.

#### POINT

- (1) If errors frequently occur in the QD75P□N/QD75D□N, "\*\*HST.LOSS\*\*" (instead of an actual error code) may be displayed in the Error Code column.

(Display example)

| No. ▾ | Error Code        | Date and Time       | Model Name | Start I/O | ▲ |
|-------|-------------------|---------------------|------------|-----------|---|
| 00200 | 00CF              | 2011/06/28 02:52:50 | QD75P4N    | 0000      |   |
| 00199 | 020C              | 2011/06/28 02:51:24 | QD75P4N    | 0000      |   |
| 00198 | <b>'HST.LOSS'</b> | 2011/06/28 02:50:09 | QD75P4N    | 0000      |   |
| 00197 | 020C              | 2011/06/28 02:49:28 | QD75P4N    | 0000      |   |
| 00196 | 020C              | 2011/06/28 02:47:58 | QD75P4N    | 0000      |   |

If "\*\*HST.LOSS\*\*" is frequently displayed, set a larger value for the number of errors collected per scan in the PLC RAS tab of the PLC Parameter dialog box. For the setting, refer to the QnUCPU User's Manual (Function Explanation, Program Fundamentals).

- (2) If the error occurred at the simultaneous start, the axis No. in which the error is detected is stored in the "Starting axis" in Error History.

## Appendix 11 MELSEC Explanation of positioning terms

### 1-2 PHASE EXCITATION SYSTEM

This is one system for exciting each stepping motor coil in a determined order. In this system, one phase and two phases are alternately excited.

### 2-PHASE EXCITATION SYSTEM

This is one system for exciting each stepping motor coil in a determined order. In this system, a current constantly flows to 2 phases to carry out step feed.

### 2-SPEED TRAPEZOIDAL CONTROL

In this positioning control method, the positioning pattern, positioning addresses (P1, P2), and positioning speeds (V1, V2) are set in the sequence program. Positioning is carried out to positioning address P1 by issuing the 1st positioning start command. When P1 is reached, the positioning then automatically changes to positioning at the V2 speed.

### 2-PHASE PULSE

An A phase and B phase double pulse. There is a phase difference between the two phases, so that difference can be automatically added and subtracted in the pulse count. The standard phase difference is a 90° electrical angle.

If the B phase were to lag behind the A phase in a forward run (B phase turns ON after the A phase), the A phase would lag behind the B phase in a reverse run (A phase turns ON after the B phase). In this way the forward and reverse run (addition and subtraction) can be automatically carried out.

## ABSOLUTE ENCODER

This is a detector that enables the angle data within 1 motor rotation to be output to an external destination. Absolute encoders are generally able to output  $360^\circ$  in 8 to 12 bits. Incremental encoders have a disadvantage in that the axis position is lost when a power failure occurs. However, with absolute encoders, the axis position is not lost even when a power failure occurs. Various codes such as a binary code and BCD code can be output. Absolute encoders are more expensive, more accurate, and larger than incremental encoders. Refer to "ENCODER".

## ABSOLUTE POSITION DETECTION SYSTEM

In the absolute position detection system, once an OPR is carried out at the system startup, the system stores the machine position in the memory and retains the current position even when the power is turned OFF. Mechanical deviation will be compensated, so that the OPR is not required after the power is turned ON next time. Configuring this system requires a motor with an absolute position detector and a servo amplifier and positioning module compatible with an absolute position detection system.

## ABSOLUTE SYSTEM

This is one system for expressing a positioning address.

Absolute address system.

This system uses 0 as a reference, and expresses the address as the distance from 0. The direction is automatically determined, even when it is not designated. The other address system is the increment system.

## ACCELERATION TIME

The parameter acceleration time refers to the time from a stopped state to the time the speed limit value is reached, so it becomes proportionally shorter as the setting speed decreases. The acceleration time is determined by factors such as machine inertia, motor torque, and load resistance torque.

## ADDRESS

- 1) This is a numerical value to express the positioning position, designated in mm, inch, angle, or No. of pulse units.
- 2) The memory address. Many addresses are stored in the memory. An address is read or written after it is designated.

## AFTER mode

This is the mode that outputs the M code after positioning is complete (after stopping). Clamping can be commanded, drilling dimensions can be selected, etc., with this mode.

## AUTO TUNING (Automatic Tuning)

Properties such as responsiveness and stability of machines driven with a servomotor are affected by changes in the inertia moment and rigidity due to changes in the machine load, etc.

This function automatically adjusts the speed loop gain and position loop gain to match the machine state, so the machine's performance can be maintained at its optimum state.

A real time automatic tuning function should be used for machines having large load fluctuations.

## BACKLASH COMPENSATION

When a forward run operation changes to a reverse run operation, there is sometimes play (backlash) in the mesh of the toothed gears. This also occurs when using a worm gear. Because of this backlash, a left feed of 1m carried out after a right feed of 1m will not be sufficient to return the machine to its original position. The machine cannot be positioned to its original position without an extra feed equivalent to the backlash amount. This function compensates for that backlash amount.

## BACKUP FUNCTION

Backup functions consist of the following.

- 1) Functions for storing the sequence program and device statuses stored in the RAM memory of the CPU module, so that they are not lost during power failures, etc.
- 2) Functions for storing the current value in absolute position compatible systems so that it is not lost during power failures, etc.
- 3) Functions for reading the CPU module data (programmable controller programs, parameters, positioning data, etc.) by a peripheral device when the old CPU module is replaced, and then write it to the new CPU module after the replacement is completed.

## BALL SCREW

This is a type of screw, with balls lined up in the threads like ball bearings. This reduces backlash, and enables rotation with little force.

## BIAS SPEED AT START

A large amount of torque is required when the machine starts moving, but the torque may be unstable at speed 0 with stepping motors. Therefore, movement can be smoothly carried out by starting the movement at a given speed from the beginning. The bias speed at start is the speed set at that start.

## BIPOLAR DRIVE CONSTANT-CURRENT SYSTEM

This is one system for driving a stepping motor. In this method, the orientation of the excitation current flowing to the stator coil is reversed, and the excitation current direction is in both the positive and negative direction. This enables the motor coil to be used effectively, and a large output torque can be obtained at low speeds.

Bipolar drive basic circuit (bridge method)

## BUFFER MEMORY

Memory used to temporarily store data. Before writing external data to the CPU module data memory, it is first temporarily stored in the buffer memory to be used for operation by the program. The buffer memory is used by the positioning module because the latest data can be read and written.

## BUSY

The device is doing some other work. It is in a positioning operation or in dwell time.

## CCW (Counterclockwise)

Rotation in the counterclockwise direction. In the motor, this is determined looking from the shaft end side. Also refer to "CW".

## CHANGE signal

The CHANGE signal is an external signal used to switch the speed-position control from the speed control being executed to position control.

## CIRCULAR INTERPOLATION

Automatic operation in which the machine path makes a circle when positioning is carried out by simultaneously operating both the longitudinal feed and latitudinal feed motors. The normal unit is 90°. Round shapes can be created with this type of interpolation, and obstacles in the machine path can also be avoided. Refer to the terms "INTERPOLATION OPERATION" and "LINEAR INTERPOLATION"

## COMMAND PULSE

Refer to term "FEEDBACK PULSE".

## COMPOSITE SPEED

The movement speed for the target control during interpolation operations.

## CONTROL UNIT

This is one type of positioning reference data. The unit to be used is designated as mm, inch, degree, or pulse.

## CP CONTROL (Continuous Path Control)

Continuous path is a control method in which a path is followed without interrupting such as in uniform speed control.

**CREEP SPEED**

A speed at which the machine moves very slowly.  
It is difficult for the machine to stop accurately when running at high speed, so the movement must first be changed to the creep speed before stopping.  
Refer to the term "NEAR-POINT DOG".

**CURRENT FEED VALUE**

The OP address at the completion of the machine OPR is stored.  
The position currently being executed is stored.  
This value changes when the current value is changed.

**CURRENT LOOP MODE**

One of the servo control modes in positioning.  
Mode which uses current for torque control.  
Also called the torque loop mode.  
Refer to the section of "position loop mode".

**CURRENT VALUE**

This is the current address (position) when stopped or during positioning.

**CW (Clockwise)**

Rotation in the clockwise direction. Rotation in the clockwise direction looking from the motor shaft end side.

**D/A CONVERTER (Digital-to-Analog converter)**

A device having a function to convert the digital value expressing the No. of pulses to an analog value expressing the voltage (or current).

**DATA NO.**

To carry out positioning to 2 or more addresses, each position is assigned a sequence No. such as No. 1, No. 2, No. 3, etc. The positioning is then carried out following this sequence. The QD75 is capable of positioning up to No. 600.

**DECELERATION RATIO**

A ratio used when the machine is decelerated using a toothed gear. This ratio is a numeral larger than 1.

$$\text{Deceleration ratio} = \frac{\text{Input gear speed}}{\text{Output gear speed}}$$

**DECELERATION TIME**

The parameter deceleration time is the same value as the acceleration time. Deceleration time refers to the time from the speed limit value to a stopped state, so it becomes proportionally shorter as the setting speed decreases.

## DEVIATION COUNTER

Deviation counters have the following two functions.

- 1) To count the command pulses issued from the QD75, and transmit the count value to the D/A converter.
- 2) To subtract the feedback pulses from the command pulses, and run the motor by the deviation value (droop pulse) of the command pulses and feedback pulses until the command pulses reaches 0.

## DIFFERENTIAL OUTPUT TYPE

This is one type of encoder feedback pulse output. When one signal is output with this method, a companion signal having the reverse polarity is simultaneously output. This method enables high-frequency transfer, and is resistant to noise, etc., so it is also used in high-speed signal transfer such as inputting and outputting of pulse trains. In general, the transmission side is called the driver, the reception side is called the receiver, and a dedicated IC is used.

## DIGITAL BUS CONNECTION

Commands are generally output from the positioning module to the servo amplifier as a pulse train. Recently, however, devices are being digitalized. Accompanying that, a connection method has appeared in which the bus lines of both the positioning module and the servo amplifier CPUs are connected. This has enabled the construction of higher-accuracy, higher-speed systems.

The MELSEC A70D, AD774M, A171SCPU, A273UCPU etc., models employ this digital bus connection.

## DOG SIGNAL

The near-point dog of the OPR.

## DRIVE UNIT

The commands (such as pulses) output from the positioning module are low-voltage, low-current commands with insufficient energy to run the motor.

The drive unit increases the width of these commands so the motor can be run. It is an accessory on servomotors and stepping motors. Also called a servo amplifier.

## DRIVE UNIT READY

This signal is output when the drive unit for the motor is in a READY state.

This signal remains OFF when the drive unit power is OFF, or during faults, etc.

## DROOP PULSE

Because of inertia ( $GD^2$ ) in the machine, it will lag behind and not be able to track if the positioning module speed commands are issued in their normal state.

Thus, for a servomotor, a method is used in which the speed command pulses are delayed by accumulation in a deviation counter. These accumulated pulses are called the droop pulse.

The deviation counter emits all pulses and returns to 0 when the machine stops.

## DWELL TIME

This is the time taken immediately after the positioning is completed to adjust for the droop pulses in the deviation counter. The positioning will not be accurate if this time is too short.

## DYNAMIC BRAKE

When protection circuits operate due to power failures, emergency stops (EMG signal) etc., this function is used to short-circuit between servomotor terminals via a resistor, thermally consume the rotation energy, and cause a sudden stop without allowing coasting of the motor.

Braking power is generated by electromagnetic brakes only when running motors with which a large brake torque can be obtained. Because electromagnetic brakes have no holding power, they are used in combination with mechanical brakes to prevent dropping of the vertical axis.

## ELECTROMAGNETIC BRAKE

This function is supplied on motors with electromagnetic brakes. Electromagnetic brakes are used to prevent slipping during power failures and faults when driving a vertical axis, or as a protective function when the machine is stopped.

These brakes are activated when not excited.

## ELECTRONIC GEAR

This function electrically increases/decreases the command pulses from the pulse command module by 1/50 to 50-fold. Thus, the positioning speed and movement amount can be controlled by the electronic gear ratio magnification.

## EMERGENCY STOP

Emergency stops cannot be carried out by the QD75, so a method of shutting OFF the servo side power supply from outside the programmable controller, etc., must be considered.

## ENCODER

This device turns the input data into a binary code of 1 (ON) and 0 (OFF). A type of pulse generator.

Rotary encoder

Linear encoder

## ERROR CORRECTION

If a dimension error occurs in the machine, and that error is actually smaller or larger than 1m in spite of a 1m command being issued from the QD75, that error amount will be compensated. For example, when the error is actually smaller than 1m, the remaining distance to 1m is fed, and the correct 1m of positioning is carried out.

## ERROR RESET

This resets error of axis. Note that if the cause of the error is not eliminated at that time, the error will occur again.

## EXTERNAL REGENERATIVE BRAKE RESISTOR

This is also called the regenerative brake. When a machine is moved with a motor, power is normally supplied to the motor from an amplifier. However, the rotation energy in the motor and machine counterflows (regenerates) to the amplifier when the motor is decelerating or when driving a descending load. The external regenerative resistor consumes this regeneration energy with resistance, obtains the regenerative brake torque, and enables the full capacity of the regeneration system during stopping. It is used when carrying out highly repetitive acceleration/deceleration.

## F

In the QD75, F is a status where the module itself has a fault.  
[HOLD]

## FAST OPR

The axis returns to the machine OP at the OPR speed without detecting the near-point dog.  
(This is not validated unless a machine OPR has been carried out first.)

## FEED PULSE

This is a pulse issued from the positioning module to a servomotor or stepping motor. Also called a command pulse.

## FEED SCREW

This is the basic screw in mechanisms that position using screw rotation. Ball screws are often used to reduce backlash and dimension error.

## FEEDBACK PULSE

This is a method of using a returning pulse train to confirm whether the machine faithfully operated according to the commands issued in automatic control. If the machine did not faithfully operate according to the commands, a correction command is issued. For example, if a command is issued for 10,000 pulses, and a feedback pulse of 10,000 pulses is returned, then the balance becomes 0 and it can be judged that the command was faithfully followed.

Refer to the term "DEVIATION COUNTER".

## FIXED-FEED

This is the feeding of a set dimension for cutting sheet and bar workpieces into the designated dimensions. Incremental system positioning is often used. The current value is not incremented, even when the feed operation is repeated.

## FLASH MEMORY

This battery-less memory can be used to store parameters and positioning data for backup. Because it is battery-less, battery maintenance is not required.

## FLAT TYPE MOTOR (PANCAKE MOTOR)

About 100mm shorter in axial dimension than the standard motor. Used when the servomotor is installed in a small space.

**FLS SIGNAL (forward limit signal)**

This is the input signal that notifies the user that the limit switch (b contact configuration, normally ON) installed at the upper limit of the positioning control enabled range has been activated.

The positioning operation stops when the FLS signal turns OFF (non-continuity).

**G CODE**

These are standardized (coded) 2-digit numerical values (00 to 99) designating various control functions of the NC module. Also called G functions.

Example :

- G01 Linear interpolation
- G02 Circular interpolation CW (clockwise)
- G04 Dwell
- G28 OPR
- G50 Max. spindle speed setting

**GAIN**

The changing of the ratio between two values having a proportional relation. Seen on a graph, the changing of the incline of the characteristics.

For example, when 10 is output for an input of 10, the output can be changed to 12, 5, etc., by changing the gain.

**GD<sup>2</sup>**

The inertia moment. The sum total of the mass (dm) of each small area configuring an object multiplied by the square of the distance (r) of each of those areas from a given straight line. The relation with  $I = \int r^2 dm$  GD<sup>2</sup> is given by  $4gl$ , with "g" being gravitational acceleration.

**INCREMENTAL ENCODER**

A device that simply outputs ON/OFF pulses by the rotation of the axis. 1-phase types output only A pulses, and do not indicate the axis rotation direction. 2-phase types output both A and B pulse trains, and can judge the rotation direction. The direction is judged to be forward if the B pulse train turns ON when A is ON, and judged to be reverse if A turns ON when B is ON. There is also another type of incremental encoder with a zero signal. The most commonly used incremental encoders output between 100 and 10,000 pulses per axis rotation. Refer to "ENCODER".

**INCREMENTAL SYSTEM**

The current value is 0 in this system. Positions are expressed by the designated direction and distance of travel. Also called the relative address system. This system is used in fixed-feed, etc. Compare ABSOLUTE SYSTEM.

**INERTIA**

The property of an object, when not being affected by external forces, where it tries to maintain its current condition. The inertia moment.

## INPUT TERMINAL

This is a pin connector wired by the user for inputting data to the QD75 from an external source. It is connected to the motor drive unit or machine side.

This terminal is used to output the following.

- DRIVE UNIT READY signal
- START signal
- STOP signal

, etc.

The input No. Xn is not directly related to the program, so it is not used.

## INTERLOCK

In this condition, the machine is blocked from moving to the next operation until the operation in progress is complete. This function is used to prevent damage to devices and malfunctioning.

## INTERPOLATION OPERATION

The simultaneous operation of multiple motors to carry out a composite operation. Each motor can be freely set with the positioning distance, acceleration/deceleration time, speed, and other factors, which are combined to move a target in a straight line, circle, etc. Linear interpolation and circular interpolation are available. (The circular interpolation uses two motors.)

## INVERTER

This refers to a device to change a direct current (DC) to an alternating current (AC). The device actually changes the motor speed by changing 50Hz or 60Hz of commercial frequency to direct current once, then changing it again to a 5 to 120Hz alternating current and controlling the motor speed.

## JOG

Jog. This refers to moving the tool little by little. Inching.  
Parameter setting is required to carry out JOG operation.

## kPPS

This is the abbreviation for "kilopulses per second". 80kPPS equals 80,000 pulses per second.

## LIMIT SWITCH

This is a switch set to stop a moving object at both ends, etc., of a movement device for safety reasons.

A circuit is created in which the moving body itself presses against the switch to activate the contact and forcibly shut the power OFF. For example, pressing on the actuator in the drawing below activates the internal microswitch. There are various other types.

## LINEAR INTERPOLATION

This automatic operation simultaneously operates two motors for the latitudinal (X) feed and longitudinal (Y) feed to move a target in a diagonal line for positioning. Three or four motors can also be operated simultaneously. The QD75 combines the operation of axis 1 through 4 for the linear interpolation. The same positioning data No. must be used for the setting. Refer to the term "INTERPOLATION OPERATION".

## LOAD INERTIA RATIO

$GDL^2/GDM^2$   
Refer to "GD<sup>2</sup>".

## LOW-INERTIA MOTOR

This is a motor used when frequent acceleration/deceleration is repeated. Low-inertia motors are longitudinally longer, to decrease the rotor diameter and cover the torque. This enables their inertia moment to be reduced up to 1/3 that of standard motors. The ideal load inertia ratio is 1 or less.

## M CODE (Machine Code)

These are sub functions that interlock with the positioning operation to replace drills, tighten and loosen clamps, raise and lower welding electrodes, display various data, etc. Either of two modes can be entered when the machine code turns ON: AFTER or WITH. The machine does not move to the next positioning when the machine code is ON. M codes are turned OFF by the programmable controller program. Code Nos. from 1 to 65535 assigned by the user and used (1: Clamp, 2: Loosen, etc.). Comments can be written after 50 of the M codes, and they can be monitored using a peripheral device or displayed on an external display. Refer to "AFTER MODE" and "WITH MODE".

## MACHINE FEED VALUE

The OP address at the completion of the machine OPR is stored. The current position of the machine coordinates determined by a machine having the OP address as a reference. Even if the current value is changed, this value will not change.

## MANUAL PULSE GENERATOR

The handle of this device is manually rotated to generate pulses. This device is used when manually carrying out accurate positioning.

Made by Mitsubishi Electric Corp.  
(model: MR-HDP01)

## MASTER AXIS

When carrying out interpolation operations, this is the side on which the positioning data is executed in priority. For example, when positioning with the X axis and Y axis, the side with the largest movement distance will become the master axis, and the speed will follow that axis. The slave axis speed will be ignored.

## MOVEMENT AMOUNT PER PULSE

When using mm, inch, or degree units, the movement amount is calculated and output from the machine side showing how much the motor shaft moves per pulse. Positioning accuracy in smaller units is not possible. On the motor side, the movement amount per axis rotation is normally designed as a reference, so it is calculated as follows.

Movement amount per pulse =

$$\frac{\text{P rate}}{\text{No. of pulses per encoder rotation}} \times \text{Movement amount per rotation}$$

## MULTI-PHASE PULSE

A combination of pulses in which 2 or more phases differ. 2-phase pulses, etc.

## MULTIPLYING RATE SETTING

The P rate. Refer to the term "P RATE".

### NC LANGUAGE (Numerical Control Language)

This is the language punched into the paper tape that instructs the machining to the NC module.

The NC language consists of EIA codes (EIA language), ISO codes (ISO standards), and JIS codes (JIS standards).

### NEAR-POINT DOG

This is a switch placed before the OP. When this switch turns ON, the feedrate is changed to the creep speed. Because of that, the time that this switch is ON must be long enough to allow for the time required for deceleration from the feedrate to the creep speed.

### NEW CURRENT VALUE (CURRENT VALUE CHANGING)

The QD75 has no way of knowing the current value when the machine is assembled and the positioning module is connected, so this function is used to teach it a temporary approximate value as the current value. This function can also be used to write a temporary current value when the current value has been lost due to accidents, etc. If an OPR is carried out after that, the positioning module will recognize the zero point.

To prevent the accumulated value from exceeding the stroke limit in fixed-feed, etc., rewrite the current value to 0 after the fixed-feed. The current value can be changed during a positioning stop.

### OP

This is the reference position for positioning. Positioning cannot start without a reference point.

The OP is normally set to the upper or lower stroke limit.

### OP SHIFT FUNCTION

The OP position can be shifted in the positive or negative direction by executing a machine OPR and determining the shift amount from the machine OPR complete position.

An OP can be set at a position besides the OP position, or outside the dog switch.

### OPERATION PATTERN

The kind of operation to be carried out after executing the positioning data is determined.

- 1) If "POSITIONING COMPLETE" is selected, the operation will stop after the positioning is complete.
- 2) If "CONTINUOUS POSITIONING CONTROL" is selected, the next data No. will be automatically executed after the positioning is complete.
- 3) If "CONTINUOUS PATH CONTROL" is selected, the positioning will not be completed. Only the speed will be automatically changed, and the next data No. will be executed.

### OPR METHOD

The OPR methods are shown below. The method used depends on the machine structure, stopping accuracy, etc.

OPR can be carried out when the OPR parameters are written.

- 1) Near-point dog method
- 2) Stopper method
- 3) Count method

## OPR PARAMETER

This parameter is required when returning to the OP. It is determined by the machine side design, so subsequent changes of this parameter must be accompanied by changes in the machine design.

The OP is the reference for positioning operations, so if the OP is lost due to a power failure during positioning, or because the power is turned OFF and the machine is moved manually, etc., it can be restored by carrying out an OPR. When a machine OPR command is issued, the machine will move in search of the near-point dog regardless of the current value, and will stop at the OP. At this time, the current value will be rewritten to the OP address. Data cannot be written during positioning. With the QD75, data is always written for all axes (from 1 to 4 axes). Refer to the term "NEAR-POINT DOG".

## OPR REQUEST

This signal turns ON when there is an error with the QD75. It will turn ON in the following situations.

- 1) When the power is turned ON.
- 2) When the PLC READY signal turns from OFF to ON.
- 3) When the machine OPR starts.
- 4) When the drive unit READY signal turns from ON to OFF.

The user judges whether to carry out a machine OPR in the above situations.

## OUTPUT TERMINAL

This is a pin connector for outputting data from the QD75 to an external source. It is connected to the motor drive unit.

This terminal is used to output the following.

- Feedback pulses for both forward run and reverse run
- Start
- Deviation counter clear

The terminal Nos. are determined for each axis.

The output No. Yn is not directly related to the program, so it is not used.

## OVERRIDE FUNCTION

With this function, the speed during positioning operations (current speed) can be varied between 1 and 300%.

The speed can also be changed by the same variable rate for continuous positioning with differing designated speeds.

## P RATE (Pulse Rate)

A coefficient that magnifies the feedback pulses per motor shaft rotation by 2-fold, 3-fold, 1/2 or 1/3.

It is the ratio of the feed pulses and feedback pulses.

For example, when the No. of pulses per motor shaft rotation is set to 2400 pulses, and the P rate is set to 2, the result will be equivalent to 1200 pulses.

The rotation per pulse is  $0.15^\circ$  when 2400 pulses per rotation are set, but this becomes  $0.3^\circ$  when 1200 pulses. The positioning accuracy drops as the P rate is increased.

## PARAMETER

This is the basic data used in positioning.

Parameters are determined by the machine side design, so subsequent changes of parameters must be accompanied by changes in the machine design.

Data cannot be written during positioning. The initial parameter values are written by the maker.

## PG0 (Pulse Generator Zero)

Pronounced "pee-jee-zero". Refer to the term "ZERO SIGNAL".

## POSITION CONTROL

This is mainly the control of position and dimension, such as in fixed-feed, positioning, numerical control, etc. This is always controlled with feed pulses. There is also speed control.

Drive units may differ, even when the same motor is used.

## POSITION DETECTION MODULE

This is an abridged version of positioning. There are two types on MELSEC, the A1S62LS. This module has positioning and limit switch functions, and can use a total of 16 channels. The following drawing shows an example for 5 channels. A resolver is used in the positioning detection.

## POSITION LOOP GAIN

This is the ratio of the deviation counter droop pulses to the command pulse frequency.

$$\text{Position loop gain} = \frac{\text{Command pulse frequency}}{\text{Droop pulses}} (1/s)$$

The position loop gain can be set with the drive unit. Raise the gain to improve the stopping accuracy. However, overshooting will occur if the position loop gain is raised too far, and the operation will become unstable. If the position loop gain is lowered too far, the machine will stop more smoothly but the stopping error will increase.

## POSITION LOOP MODE

This is one servo control mode used in positioning. It is a mode for carrying out position control. The other servo control modes are the speed loop mode for carrying out speed control, and the torque loop mode for carrying out torque control (current control).

## POSITIONING

Accurately moving the machine from a point to a determined point. The distance, direction, speed, etc., for that movement are designated by the user. Positioning is used in operations such as cutting sheets, drilling holes in plates, mounting parts on a PCB, and welding. Positioning is also used with robots.

## POSITIONING COMPLETE

Refer to the term "OPERATION PATTERN".

## POSITIONING COMPLETE SIGNAL

This is a signal that occurs when the positioning is complete. A timer set beforehand starts when this signal is output, and the machine movement stops for that time. When this signal turns ON, the positioning start signal turns OFF.

## POSITIONING CONTINUED

Refer to the section of term "operation pattern".

## POSITIONING DATA

This is data for the user to carry out positioning. The No. of points to which positioning is carried out (the No. of addresses) is designated by the user. In the QD75, these are 600 points. As a principle, positioning is executed in the order of the data Nos.

## POSITIONING PARAMETER

This is basic data for carrying out positioning control. Types of data include control unit, movement amount per pulse, speed limit value, upper and lower stroke limit values, acceleration/deceleration time, positioning system, etc.

Parameters have an initial value, so that value is changed to match the control conditions.

## POSITIONING START

This refers the act of designating a target data No. and starting the positioning.

The operation after the positioning is complete for that data No. is determined by the data No.'s positioning pattern.

## PTP Control (Point To Point Control)

This is a type of positioning control. With this control method, the points to be passed are designated at random locations on the path. Movement only to a given target positioning is requested. Path control is not required during movement from a given point to the next value.

## PULSE

The turning ON and OFF of the current (voltage) for short periods. A pulse train is a series of pulses. The QD75 is the module that generates the pulses.

## PULSE GENERATOR

This is a device that generates pulses.

Examples include devices installed on the motor shaft that create pulses when the shaft rotates, and digital devices.

1-phase types output one pulse train. 2-phase types output two pulse trains with a phase difference. From 600 to 1,000,000 pulses can be output per shaft rotation. Generators with a ZERO signal function to output 1 or 2 pulses per shaft rotation. Abbreviated as PLG. Refer to the term "ENCODER".

## PULSE OUTPUT MODE

There are two methods used to issue forward run and reverse run commands to the servomotor. The type used differs according to the machine maker. In type A, the forward run pulses and reverse run pulses are output from separate terminals.

In type B, the forward run pulses and reverse run pulses are output from the same terminal, and a forward/reverse run identification signal is output from another terminal.

## READY

This means that preparation is complete.

## REAL-TIME AUTO TUNING (Real-time Automatic Tuning)

Refer to "AUTO TUNING".

## REFERENCE AXIS SPEED

This is the speed of the reference axis during interpolation operations.

## REGENERATIVE BRAKE OPTION

This function is an option. It is used when carrying out highly repetitive acceleration/deceleration. Refer to "EXTERNAL REGENERATIVE RESISTOR".

## RESOLVER

This device detects the angle by resolving the two voltages of the analog input. Also called a 2-phase synchro. For a 1-phase voltage input, the axis rotation angle is converted into a perpendicular 2-phase voltage (analog voltage) and output.

## RLS SIGNAL (reverse limit signal)

This is the input signal that notifies the user that the limit switch (b contact configuration, normally ON) installed at the lower limit of the positioning control enabled range is activated. The positioning operation stops when the RLS signal turns OFF (non-continuity).

## ROTARY TABLE

A round table on which the workpiece is placed. Positioning control is carried out while rotating the workpiece in a 360° range.

## S-CURVE

### ACCELERATION/DECELERATION

In this pattern, the acceleration and deceleration follow a sine curve, and the movement is smooth. The S-curve ratio can be set from 1 to 100%.

## SERVO AMPLIFIER

Refer to the term "DRIVE UNIT".

## SERVO LOCK

In positioning using a servomotor, stepping motor, etc., working power is required to hold the machine at the stop position. (The position will be lost if the machine is moved by external power.) This kind of state is called servo lock or servo lock torque.

## SERVO ON

The servo amplifier will not operate if the servo amplifier is in a normal state and this servo ON signal is OFF.

## SERVOMOTOR

A motor that rotates true to the command. Servomotors are highly responsive, and can carry out frequent high-speed and high-accuracy starts and stops. DC and AC types are available, as well as large-capacity motors. A pulse generator accessory for speed detection is common, and feedback control is often carried out.

## SETTING UNIT

This is one setting item of the positioning reference parameters. The unit to be used is designated as mm, inch, degree, or pulse.

## SFC (Sequential Function Chart)

A sequential function chart is a programming method optimally structured for running a machine's automatic control in sequence with the programmable controller.

## SKIP FUNCTION

When a SKIP signal is input, the positioning being executed is interrupted, the motor is deceleration stopped, and the next positioning is automatically carried out.

## SLAVE AXIS

During interpolation operation, the positioning data is partially ignored on this side. This axis is moved by the master axis data.

## SPEED CONTROL

Speed control is mainly carried out with the servomotor. It is an application for grindstone rotation, welding speed, feedrate, etc. Speed control differs from position control in that the current position (address) is not controlled. Drive units may differ, even when the same motor is used.

## SPEED INTEGRAL COMPENSATION

This is one item in the parameters of the servo amplifier, and is used to raise the frequency response during speed control to improve transient characteristics.

When adjusting the speed loop gain, raising this value is effective if the overshooting during acceleration/deceleration remains large.

This compensation is set in ms units.

## SPEED LIMIT VALUE

This is the max. speed for positioning. Even if other data is mistakenly set to a higher speed than this, the positioning will be carried out at this speed limit value when it is set in the parameters. The acceleration time becomes the time to accelerate from a stopped state to the speed limit value, and the deceleration time becomes the time to decelerate from the speed limit value to a stopped state.

## SPEED LOOP GAIN

This is one item in the parameters of the servo amplifier, and expresses the speed of the control response during speed control. When the load inertia moment ratio increases, the control system speed response decreases and the operation may become unstable. If this happens, the operation can be improved by raising this setting value.

The overshoot will become larger if the speed loop gain is raised too far, and motor vibration noise will occur during operation and when stopped.

## SPEED LOOP MODE

This is one servo control mode used in positioning. It is a mode for carrying out speed control. Refer to "POSITION LOOP MODE".

## SPEED-POSITION SWITCHING CONTROL

With this control, positioning is carried out to the end point of the movement amount while changing the speed at the speed switching point during positioning control.

## SPEED-POSITION SWITCHING CONTROL MODE

This is one method used for positioning. It is an application for operations such as high-speed movement to a point unrelated to positioning, then set dimension movement from the switching signal activation point.

## START COMPLETE

This signal gives an immediate response notifying the user that the QD75 that was started is now in a normal state and can start positioning.

## STARTING AXIS

One of the QD75 axis system axes (axis 1, axis 2, axis 3, or axis 4) or the reference axis for the interpolation operation is designated as the starting axis.

## STATUS

Data showing the state of the machine. Collectively refers to signals that turn ON when the battery voltage drops, during OPR requests, during dwell time, etc.

## STEP FUNCTION

When the operation is designed so that several positioning data Nos. are consecutively run, this function can be used to carry out a test operation for 1 data item at a time.

## STEP OUT

Stepping motors rotate in proportion to the No. of pulses (frequency), but the motor's rotation will deviate if the load is too large for the motor. This is called step out. If step out occurs, the motor must be replaced by one with a larger torque. Step out causes the positioning error to increase.

## STEPPING MOTOR

A motor that rotates a given angle (example:  $0.15^\circ$ ) when 1 pulse is generated.

For that reason, a rotation proportional to the No. of pulses can be obtained. 2-phase to 5-phase stepping motors are available. In the 3-phase type, the rotor rotates in order from A to C when a voltage is applied. Often found in compact motors, stepping motors rotate accurately without feedback. Be careful of step out when overloaded.

1) First, the A phase is excited by a pulse.

2) When the B phase is then excited, the force works in the direction shown by the arrows.

3) The nearest tooth to the B phase is attracted, and the rotation stops.

4) As the excitation phase is continuously changed, the rotor rotates in a clockwise direction.

## STOP SETTLING TIME

Refer to the term "DWEELL TIME".

## STOP SIGNAL

In positioning control, this is the input signal that directly stops the operation from an external source.

The operation stops when the external stop signal (a-contact) turns ON (continuity).

## STOP WITH STOPPER

This is one machine OPR method. With this method, a stopper is established at the OP, and the operation is stopped when the machine presses against it.

Motor burning would occur or the stopper would be damaged if the machine were left in that state. There are two methods to prevent this; a timer can be used to shut OFF the motor after a fixed time, or the motor can be stopped by limiting sudden increase in the motor torque when the machine presses against the stopper.

## STROKE

The stroke is the variation in the operation by the distance from a stopped state to the next stopped state after a movement.

## STROKE LIMIT

This is the range in which a positioning operation is possible, or the range in which the machine can be moved without damage occurring.

(Movement outside this range is possible in the manual operation.) For operations using a worm gear, the stroke limit is determined by the length of the screw. For operations using a fixed-feed, it is determined by the max. dimension to be cut.

The upper and lower limits are set in the parameters, but a separate limit switch should be established and an emergency stop circuit outside the programmable controller should be created. Refer to the term "LIMIT SWITCH".

## SUDDEN STOP

A stop carried out in a shorter time than the deceleration time designated in the parameters.

## TEACHING

When the positioning address is uncertain, or gauging is required, this function is used by the user to search for and teach the position to the machine.

For example, complex addresses such as drawings can be taught by tracing a model, and the positioning operation can be reproduced.

## TORQUE CONTROL

In this function, a limit is established for the resistance torque applied to the motor used for positioning. The power is turned OFF if torque exceeding that value is applied to the motor. When excessive torque is applied to a motor, it causes the current to suddenly increase. Motor burning and other stress on the motor occurs, and the life of the motor is shortened.

This function utilizes the sudden increase in the torque when the machine OPR to issue a command to stop the motor.

## TORQUE LOOP MODE

Also called the current loop mode.  
Refer to "POSITIONING LOOP MODE".

## TORQUE RIPPLE

Torque width variations, deviations in the torque.

## TRACKING FUNCTION

In this function, positioning is carried out at a speed relative to a moving target object by inputting the movement amount from an external encoder and adding it to the servo command value.

## TRAPEZOIDAL ACCELERATION/DECELERATION

An operation in which a graph of the time and speed takes a trapezoidal shape.

## TURNTABLE

A rotating table, which is turned using power. The table is used divided from one 360° rotation into the required locations for work. The positioning control unit is "degree".

## UNIT SETTING

This is the setting of the unit for the actual address to which positioning is required, or for the movement amount.

The following units can be set: mm, inch, degree and pulse. The initial value in the parameters is a pulse unit.

## WARNING

A warning is output as a warning code in when an abnormality is detected that is not serious enough to require cancellation or stoppage of the positioning operation. Warnings are handled differently than errors.

## WINDOW

These are the selection menus that appear on the screen when the QD75 is started.

- Menu selection window
- Mode function selection window
- Sub-function selection window
- Execution/setting selection window

## WITH MODE

This is the mode that outputs the M code before the start of the positioning. This mode turns ON at the positioning start, enabling voltage to be applied to the welding electrodes, display of positioning speeds, etc. Refer to the term "AFTER MODE".

## XY TABLE

This is a device that moves a table in the X (latitudinal) and Y (longitudinal) directions so that positioning can be carried out easily. There are also commercially available products.

## Z PHASE

Also called "PG zero". Refer to "ZERO SIGNAL".

## ZERO SIGNAL

This refers to PG0 of the pulse generator (encoder) (one detection per shaft rotation). It also called "Z phase". Refer to the term "PULSE GENERATOR".

## Appendix 12 Positioning control troubleshooting

| Trouble type              | Questions/Trouble                                                                                                                                         | Remedy                                                                                                                                                                                                                                                                                                                                                                                                                                             | No. |
|---------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-----|
| Parameter                 | Display reads "FFFFH" when a parameter is read with GX Configurator-QP.                                                                                   | The CPU module power was turned OFF or the CPU module was reset, etc., during flash ROM writing, which deleted the data in the flash ROM. Initialize the parameters, and reset the required parameters. (Refer to Section 13.2 "Parameter initialization function" for details.)                                                                                                                                                                   | 1   |
|                           | How can the parameters be returned to their initial values (default values)?                                                                              | Set the " <a href="#">Cd.2</a> Parameter initialization request" to "1". (Refer to Section 13.2 "Parameter initialization function" for details.)                                                                                                                                                                                                                                                                                                  | 2   |
|                           | A parameter error occurred although the parameter was set correctly by GX Configurator-QP.                                                                | The parameter may have been overwritten in the sequence program. Review the sequence program.                                                                                                                                                                                                                                                                                                                                                      | 3   |
| Hardware stroke limit     | The machine overruns if operating at high speeds when the hardware stroke limit range is exceeded.                                                        | In the QD75, deceleration stops are executed after the machine exceeds hardware stroke limit range. Because of this, more time is required for the deceleration stop as the speed increases, and the overrun becomes larger. (The deceleration time becomes shorter at lower speeds, so the overrun becomes smaller.)                                                                                                                              | 4   |
|                           | When the machine exceeded the hardware stroke limit range, positioning toward inside the range was started, but the machine did not start.                | Use a "JOG operation", "Inching operation" or "Manual pulse generator operation" to return the machine to inside the hardware stroke limit range. (When the hardware stroke limit range is exceeded, positioning will not start toward inside the range even when so commanded. Once the range is exceeded, a return to inside the range can only be executed using a "JOG operation", "Inching operation" or "Manual pulse generator operation".) | 5   |
| Degree                    | Exactly one rotation is required, but the setting range for a "degree" unit setting is "0 to 359.999...". Won't the rotation deviate by "0.00...1"?       | Designate "360.000" in the INC control. The motor will make exactly one rotation.                                                                                                                                                                                                                                                                                                                                                                  | 6   |
| Movement amount per pulse | If the "movement amount per pulse" is calculated as written in the manual, settings smaller than the basic parameter setting range cannot be carried out. | Set "movement amount per pulse" in the QD75 using the three parameter values of <a href="#">Pr.2</a> to <a href="#">Pr.4</a> . Try setting the values following the explanations for each parameter.                                                                                                                                                                                                                                               | 7   |
| Override                  | Will an override setting value written before starting be valid?                                                                                          | It will be valid.                                                                                                                                                                                                                                                                                                                                                                                                                                  | 8   |
|                           | During path control, will the override still be valid after the point is passed?                                                                          | It will still be valid.                                                                                                                                                                                                                                                                                                                                                                                                                            | 9   |
|                           | How can the override be canceled?                                                                                                                         | Set the " <a href="#">Cd.13</a> Positioning operation speed override" to "100".                                                                                                                                                                                                                                                                                                                                                                    | 10  |

| Trouble type                                  | Questions/Trouble                                                                                                                                                                            | Remedy                                                                                                                                                                                                                                                                                                                                                                                                                     | No. |
|-----------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-----|
| Acceleration/<br>deceleration time            | How can the deceleration stop time during stopping be shortened using the hardware stroke limit?                                                                                             | Set "1: Sudden stop" in the " [Pr.37] Stop group 1 sudden stop selection", and reduce the setting value of " [Pr.36] Sudden stop deceleration time".                                                                                                                                                                                                                                                                       | 11  |
|                                               | The motor does not operate at "60000ms" although the acceleration/deceleration time is set to "60000ms".                                                                                     | The value set for the acceleration/deceleration time is the time required for the machine to accelerate from speed "0" to the value set in " [Pr.8] Speed limit value". Because of that, the acceleration/deceleration time will also be shorter than "60000ms" if the command speed value is smaller than the " [Pr.8] Speed limit value". (Refer to the explanation for [Pr.9] and [Pr.10] for details.)                 | 12  |
|                                               | Can each acceleration/deceleration time be individually set to trapezoidal or S-curve acceleration/deceleration?                                                                             | The trapezoidal and S-curve acceleration/deceleration processing is a common setting for all acceleration/deceleration times, so individual setting is not possible. (Refer to Section 12.7.6 "Acceleration/deceleration process function".)                                                                                                                                                                               | 13  |
|                                               | The machine starts and stops suddenly when carrying out JOG operations and positioning operations. (Using an MR-J2S servo amplifier.)                                                        | Review the parameter settings for acceleration/deceleration time, speed limit value, JOG speed limit value, JOG acceleration/deceleration time, etc.                                                                                                                                                                                                                                                                       | 14  |
| Simplified absolute position detection system | Are simplified absolute position detection system possible in the QD75 Positional deviation models?                                                                                          | They are possible if the models are used in combination with a Mitsubishi "AC Servo". (Refer to "AC servo User's Manual" for details.)                                                                                                                                                                                                                                                                                     | 15  |
| Positional deviation                          | The physical position position detection system from the commanded position, although the positioning is complete (and the monitored current position is correct).                           | If the deviation counter value is not "0", the servo side is still moving. Increase the torque.                                                                                                                                                                                                                                                                                                                            | 16  |
| Electronic gear                               | A setting of "1 $\mu$ m = 1pulse" is required in the following system. <ul style="list-style-type: none"> <li>Ball screw pitch = 10mm</li> <li>No. of feedback pulses = 8192pulse</li> </ul> | In this case, the following values will result. <ul style="list-style-type: none"> <li>No. of pulses per rotation = 8192</li> <li>Movement amount per rotation = 10000</li> <li>Unit magnification = 10</li> </ul> Therefore, the "Movement amount per pulse" will become "1.2207 $\mu$ m". This value is fixed by the machine system, so it cannot be changed. Thus, the setting "1 $\mu$ m = 1pulse" cannot be achieved. | 17  |

| Trouble type       | Questions/Trouble                                                                                                                                                                                                                                                                                                                                            | Remedy                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            | No. |

| Start                            | The positioning start signal [Y10] is kept ON until the BUSY signal is OFF, but is there any problem with turning it OFF before the BUSY signal turns OFF?                                                                                                                                       | After the BUSY signal turns ON, there is no problem with turning [Y10] OFF before the BUSY signal turns OFF. (The QD75 detects the rising edge (OFF → ON) of the positioning start signal [Y10].)                                                                                                                                                                                                                                                                                                                                      | 25  |
|                                  | The operation will not start even when the start signal is turned ON.                                                                                                                                                                                                                            | Check the " [Md.26] Axis operation status" and " [Md.23] Axis error No.".                                                                                                                                                                                                                                                                                                                                                                                                                                                              | 26  |
| Stop                             | How many milliseconds should the axis stop signal [Y4] be turned ON for?                                                                                                                                                                                                                         | The signal should be turned ON at 4ms or more. (If possible, set the signal so it does not turn ON only momentarily, but instead stays ON until the BUSY signal turns OFF. This will keep the stop signal from skipping.)                                                                                                                                                                                                                                                                                                              | 27  |
|                                  | How can a sudden stop be selected?                                                                                                                                                                                                                                                               | Set "1: Sudden stop" in the parameter from [Pr.37] to [Pr.39] corresponding to the stop group, and reduce the setting value of " [Pr.36] Sudden stop deceleration time".                                                                                                                                                                                                                                                                                                                                                               | 28  |
|                                  | "Normal deceleration stop" was selected in " [Pr.39] Stop group 3 sudden stop", and Y stop was turned ON. If the [Pr.39] setting is changed to "sudden stop" during a deceleration stop, and the Y stop signal turns from OFF to ON, will the operation change to a sudden stop from that point? | The operation will not change. Even if the same stop factor is input again during the deceleration stop, it will be ignored. The same deceleration stop process used when the stop signal was first input will be continued. (This also applies for [Pr.37] and [Pr.38].)                                                                                                                                                                                                                                                              | 29  |
| Circular interpolation           | ABS system circular interpolation operates normally, but a vertically oblong circle results when INC system circular interpolation is carried out.                                                                                                                                               | The address designation may be incorrect. When carrying out INC system circular interpolation, designate the relative addresses from the starting point of both the center point and end point.                                                                                                                                                                                                                                                                                                                                        | 30  |
| Speed-position switching control | Can the speed be changed during speed control and position control by speed-position switching control?                                                                                                                                                                                          | No. The speed for the speed control and position control cannot be set differently.                                                                                                                                                                                                                                                                                                                                                                                                                                                    | 31  |
| JOG operation                    | Even if the JOG start signal is turned ON, the response until it turns ON is sometimes slow.                                                                                                                                                                                                     | Either of the following is possible.<br>1) The sequence program may be incorrect. Check by creating a test program in which the JOG start signal is turned ON only.<br>2) If the machine is hitting something when the torque setting is low, it may be trying to move by JOG operation in the opposite direction. In this case, the machine will start moving only after the internal droop pulses have been reached 0 in the counter, even if the JOG start signal has been turned ON. This makes it seem that the response is slow. | 32  |
|                                  | The operation is not carried out at the set JOG speed, although the speed limit value has not been reached.                                                                                                                                                                                      | Either of the following is possible.<br>1) The JOG start signal may be chattering. Monitor the JOG start signal to confirm whether it is chattering. (When using the "BUSY signal" in the JOG operation start circuit, check the position of the BUSY signal.)<br>2) The " [Pr.31] JOG speed limit value" may not be appropriate. Review the setting value and carry out the JOG operation again.                                                                                                                                      | 33  |

| Trouble type                     | Questions/Trouble                                                                                                       | Remedy                                                                                                                                                                                                                                                                                                                                  | No. |
|----------------------------------|-------------------------------------------------------------------------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-----|
| JOG operation                    | When a JOG operation is attempted, an error results and the machine does not move.                                      | The " [Pr.31] JOG speed limit value" may be larger than the " [Pr.8] Speed limit value".<br>Review the parameters and carry out the JOG operation again.                                                                                                                                                                                | 34  |
|                                  | Why does the positioning complete signal turns ON during the JOG operation?                                             | If a value other than "0" is set for " [Cd.16] Inching movement amount", the inching operation is carried out and the positioning complete signal turns ON.<br>Confirm that the " [Cd.16] Inching movement amount" is set to "0".                                                                                                       | 35  |
| Manual pulse generator operation | Is it possible to count the pulses when the B phase is set to "1", and only A phase pulses are input?                   | Not possible.<br>(The QD75 counts 1, 0, 1, 0.)                                                                                                                                                                                                                                                                                          | 36  |
|                                  | Can a manual pulse generator other than the Mitsubishi Electric MR-HDP01 be used?                                       | Other manual pulse generators can be used if they conform to Section 3.4 "Specifications for input/output interfaces with external devices."                                                                                                                                                                                            | 37  |
|                                  | Can one manual pulse generator be operated connected to several QD75 modules?                                           | This is possible if the system conforms to the electrical specifications.                                                                                                                                                                                                                                                               | 38  |
| Current value changing           | The BUSY signal is not canceled by the current value changing. How can it be canceled?                                  | The BUSY signal may remain if the scan time is long.<br>Use a complete signal to check whether the current value changing has been executed.                                                                                                                                                                                            | 39  |
| QD75 READY signal                | The QD75 READY signal does not turn ON even when the PLC READY signal [Y0] is turned ON.                                | "A parameter error" has occurred.<br>Confirm the error No. in the error history, and correct the parameter.                                                                                                                                                                                                                             | 40  |
| M code ON signal                 | Is there any problem with setting an M code ON signal OFF request in the next scan after the M code ON signal ON?       | The QD75 checks the M code ON signal OFF request every "0.9ms" (QD75P□N/QD75D□N) or "1.8ms" (QD75P□/QD75D□), so there is a possibility that the M code ON signal OFF may be delayed by a maximum of "0.9ms" (QD75P□N/QD75D□N) or "1.8ms" (QD75P□/QD75D□) after the M code ON signal ON, even if an M code ON signal OFF request is set. | 41  |
| Deviation counter clear          | How long is the output time for the deviation counter clear signal?                                                     | The time set in " [Pr.55] Deviation counter clear signal output time". (Initial value: 11ms)                                                                                                                                                                                                                                            | 42  |
|                                  | Is a deviation counter clear signal output when the positioning is complete?                                            | A signal is not output.<br>The only time the QD75 outputs a deviation counter clear signal is for a machine OPR.                                                                                                                                                                                                                        | 43  |
|                                  | How can a deviation counter clear signal be output?                                                                     | The QD75 does not output a deviation counter clear signal except for machine OPR.                                                                                                                                                                                                                                                       | 44  |
| Module                           | An error "PLC READY OFF start" (error code: 537) occurs after the QD75 is replaced. (The sequence program is the same.) | The internal parameters of the QD75 may be different.<br>Check if the QD75 READY signal [X0] turns ON when the PLC READY signal [Y0] turns ON.<br>When the PLC READY signal is ON but the QD75 READY signal is OFF, the parameter error has occurred.<br>Check the error code and modify the parameter with the error.                  | 45  |
| Motor                            | The motor only rotates in one direction.                                                                                | The parameter settings on the QD75 side may not match those on the servo side.<br>Check the parameter settings.                                                                                                                                                                                                                         | 46  |
|                                  | Can the current motor speed be monitored?                                                                               | The speed shown on the QD75 monitor is calculated from the number of pulses output from the module. Thus, the actual motor speed cannot be monitored.<br>(" [Md.22] Feedrate" monitors the commanded speed. It does not show the actual motor speed.)                                                                                   | 47  |

| Trouble type                | Questions/Trouble                                                                                                                                                                                                                            | Remedy                                                                                                                                                                                                                                                                                                                                                                                                                                                                 | No. |
|-----------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-----|
| Error/warning               | An error "Backlash compensation amount error" (error code: 920) occurs even when the backlash compensation value is set to "1".                                                                                                              | $0 \leq \frac{\text{Backlash compensation value}}{\text{Movement amount per pulse}} \leq 255$ <p>Setting is not possible if the above equation is not satisfied.<br/>Adjust by setting " [Pr.4] Unit magnification" to 10-fold (or 100-fold, or 1000-fold), and setting " [Pr.2] Movement amount per rotation" to 1/10 (or 1/100, or 1/1000).</p>                                                                                                                      | 48  |
|                             | When a JOG operation is attempted, errors such as "Hardware stroke limit (+)" or "Hardware stroke limit (-)" (error code: 104 or 105) occur and the machine does not move.                                                                   | The hardware stroke limit wiring has probably not been carried out.<br>Refer to Section 12.4.4 "Hardware stroke limit function" for details, and wire accordingly.                                                                                                                                                                                                                                                                                                     | 49  |
|                             | An error "Speed designation during OP shift error" (error code: 997) appears when the PLC READY signal [Y0] turns from OFF to ON.                                                                                                            | A value besides "0" or "1" may be set in the " [Pr.56] Speed designation during OP shift".<br>Review the set sequence program, and reset the correct parameters.                                                                                                                                                                                                                                                                                                       | 50  |
|                             | When the start signal was turned ON immediately after the stop signal ON, a warning "Start during operation" (warning code: 100) was detected, and the start was ignored.                                                                    | The QD75 starts the deceleration stop process when the stop signal ON is detected. Thus, the machine interprets that "positioning is still being executed" immediately after the stop signal ON. Even if the start signal is turned ON at that time, the start request will be ignored and a warning "Start during operation" (warning code: 100) will occur.                                                                                                          | 51  |
|                             | Does a warning "Deceleration/stop speed change" (warning code: 500) occur only during "stop deceleration" and "automatically deceleration"?<br>Is there any problem if the operation is continued in that state without resetting the error? | The warning occurs only at those times mentioned at the left. Because this is a warning, there is no problem if the operation can be continued without resetting the error.<br>(When the speed is changed using the override, the new value will not be reflected on the data being executed, but will be reflected from the next start.)                                                                                                                              | 52  |
| Positioning complete signal | Position control was executed but the positioning complete signal does not turn ON.                                                                                                                                                          | Depending on the stop occurrence factor, positioning may have not been completed normally.<br>Check the axis monitor " [Md.26] Axis operation status" after the BUSY signal has turned OFF.<br>Stop : The stop signal has turned ON during positioning.<br>Check the condition under which the stop signal (Y stop, external stop) turns ON.<br>Error : An error has occurred during positioning.<br>Check the error occurrence factor from " [Md.23] Axis error No.". | 53  |
|                             |                                                                                                                                                                                                                                              | The setting value of the detailed parameter 2 "Positioning complete signal output time" is 0 or shorter than the scan time.<br>Using the sequence program, set the time when the signal can be detected securely.                                                                                                                                                                                                                                                      | 54  |

## Appendix 13 List of buffer memory addresses

The following shows the relation between the buffer memory addresses and the various items.

(Do not use any address other than listed below. If used, the system may not operate correctly.)

| Buffer memory address |        |        |        | Item                                                              | Memory area           |                        |
|-----------------------|--------|--------|--------|-------------------------------------------------------------------|-----------------------|------------------------|
| Axis 1                | Axis 2 | Axis 3 | Axis 4 |                                                                   |                       |                        |
| 0                     | 150    | 300    | 450    | <a href="#">Pr.1</a> Unit setting                                 | Basic parameters 1    | Positioning parameters |
| 1                     | 151    | 301    | 451    | <a href="#">Pr.2</a> No. of pulses per rotation (Ap)              |                       |                        |

# WARRANTY

Please confirm the following product warranty details before using this product.

## **1. Gratis Warranty Term and Gratis Warranty Range**

If any faults or defects (hereinafter "Failure") found to be the responsibility of Mitsubishi occurs during use of the product within the gratis warranty term, the product shall be repaired at no cost via the sales representative or Mitsubishi Service Company.

However, if repairs are required onsite at domestic or overseas location, expenses to send an engineer will be solely at the customer's discretion. Mitsubishi shall not be held responsible for any re-commissioning, maintenance, or testing on-site that involves replacement of the failed module.

[Gratis Warranty Term]

The gratis warranty term of the product shall be for one year after the date of purchase or delivery to a designated place.

Note that after manufacture and shipment from Mitsubishi, the maximum distribution period shall be six (6) months, and the longest gratis warranty term after manufacturing shall be eighteen (18) months. The gratis warranty term of repair parts shall not exceed the gratis warranty term before repairs.

[Gratis Warranty Range]

- (1) The range shall be limited to normal use within the usage state, usage methods and usage environment, etc., which follow the conditions and precautions, etc., given in the instruction manual, user's manual and caution labels on the product.
- (2) Even within the gratis warranty term, repairs shall be charged for in the following cases.
  1. Failure occurring from inappropriate storage or handling, carelessness or negligence by the user. Failure caused by the user's hardware or software design.
  2. Failure caused by unapproved modifications, etc., to the product by the user.
  3. When the Mitsubishi product is assembled into a user's device, Failure that could have been avoided if functions or structures, judged as necessary in the legal safety measures the user's device is subject to or as necessary by industry standards, had been provided.
  4. Failure that could have been avoided if consumable parts (battery, backlight, fuse, etc.) designated in the instruction manual had been correctly serviced or replaced.
  5. Failure caused by external irresistible forces such as fires or abnormal voltages, and Failure caused by force majeure such as earthquakes, lightning, wind and water damage.
  6. Failure caused by reasons unpredictable by scientific technology standards at time of shipment from Mitsubishi.
  7. Any other failure found not to be the responsibility of Mitsubishi or that admitted not to be so by the user.

## **2. Onerous repair term after discontinuation of production**

- (1) Mitsubishi shall accept onerous product repairs for seven (7) years after production of the product is discontinued. Discontinuation of production shall be notified with Mitsubishi Technical Bulletins, etc.
- (2) Product supply (including repair parts) is not available after production is discontinued.

## **3. Overseas service**

Overseas, repairs shall be accepted by Mitsubishi's local overseas FA Center. Note that the repair conditions at each FA Center may differ.

## **4. Exclusion of loss in opportunity and secondary loss from warranty liability**

Regardless of the gratis warranty term, Mitsubishi shall not be liable for compensation to:

- (1) Damages caused by any cause found not to be the responsibility of Mitsubishi.
- (2) Loss in opportunity, lost profits incurred to the user by Failures of Mitsubishi products.
- (3) Special damages and secondary damages whether foreseeable or not, compensation for accidents, and compensation for damages to products other than Mitsubishi products.
- (4) Replacement by the user, maintenance of on-site equipment, start-up test run and other tasks.

## **5. Changes in product specifications**

The specifications given in the catalogs, manuals or technical documents are subject to change without prior notice.
